

Grid Prototype Project (caGRID?)

June 24, 2004

Agenda

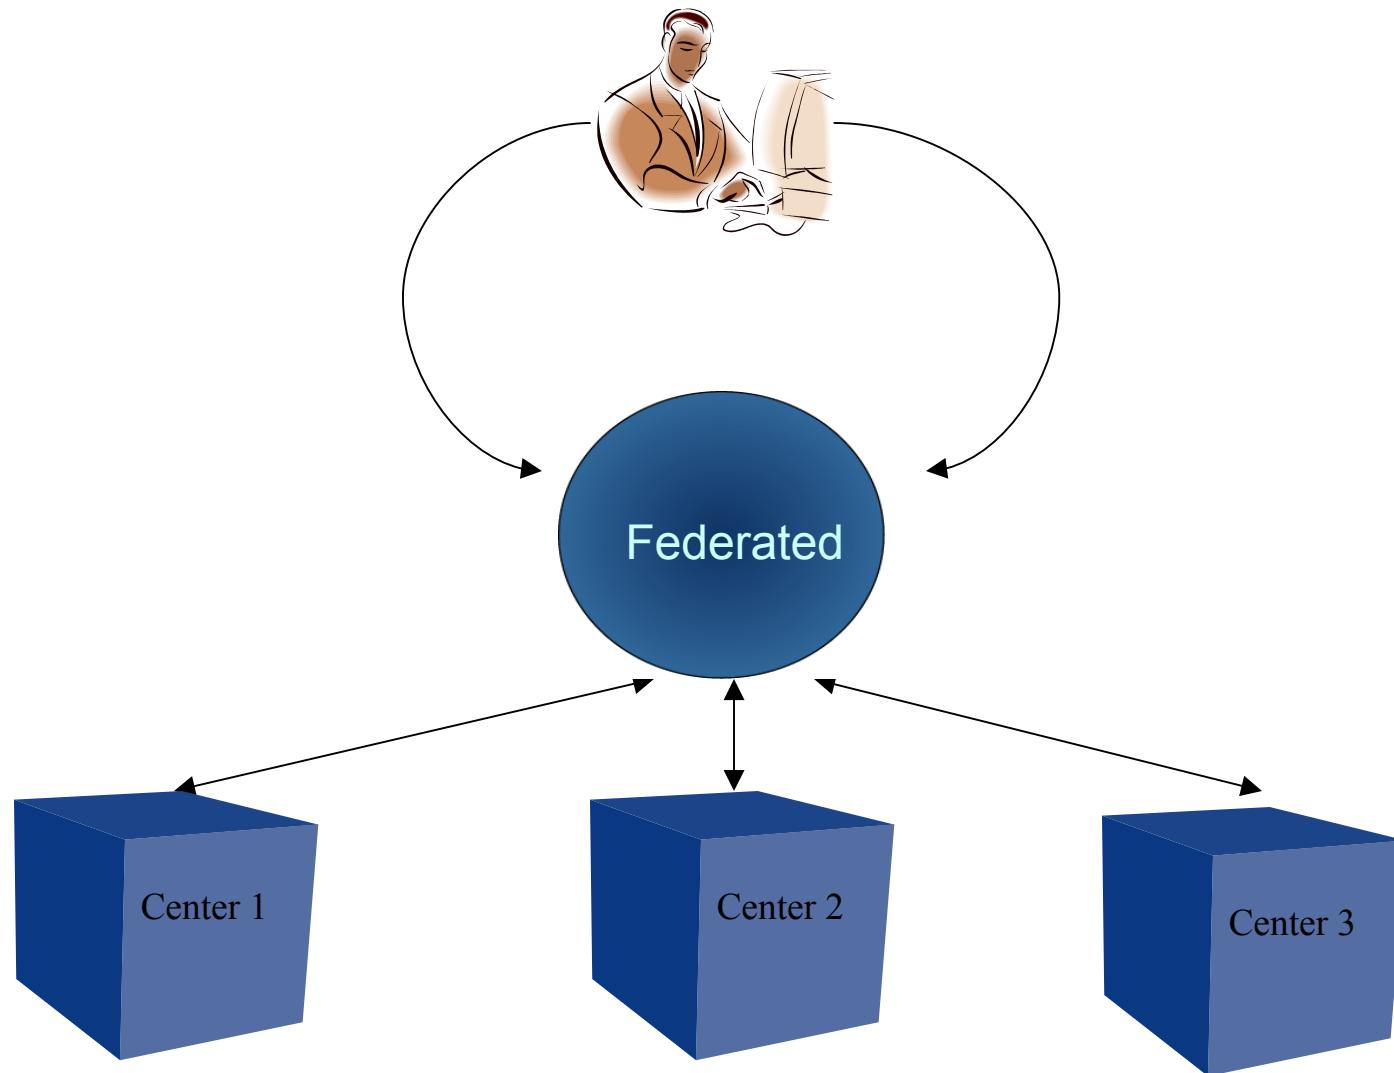

- ▶ Introduction
 - Team Members
 - Manav Kher – (SAIC)
 - William Sanchez – (SAIC)
 - Brian Gilman – (Panther Informatics)
 - Steve Pouros – (Panther Informatics)
- ▶ Requirement analysis
- ▶ Technology evaluation
- ▶ caGRID framework
- ▶ Prototype demo

Problem Statement

- ▶ Production of data is outstripping our ability to analyze it
- ▶ The research community may not be aware of other work and datasets
- ▶ Researchers may not tag data with the definition of the data they produce
- ▶ Semantic information is not often encoded nor included with data sets
- ▶ “Data Islands” or “Silo’s” of information are produced based on the problems outlined above
 - A small group of knowledgeable people transmit data amongst themselves
- ▶ “Modern” exploratory research requires the integration of disparate databases of biological information to explain results
- ▶ To elucidate the mechanism behind disease we must aggregate data from many databases

- ▶ Provide the “Grid For Cancer Research” so that we may:
 - Raise awareness of disparate datasets in the biological research community
 - Allow research groups to exchange datasets with ease
 - Allow research groups to understand the semantics of the datasets that they publish without always having to get on the phone
 - Allow for quicker publication of the analysis of integrated data

The Grid Concept

What Criteria Do We Use To Assess The Technology?

- ▶ The caGRID project team utilized the following metrics to assess the applicability of grid technologies to biological problems
 - Ability to handle large datasets
 - Robust protocols for data transmission
 - Quality of service (QOS)
 - Protocols for meta-data and semantic representations of datasets
 - Robust publication, search, and query capability
 - Mature application programming interfaces (APIs)
 - Maturity of technology
 - Change in codebase and API
 - Quality assurance best practices in place
 - Change management system in place with release notes and backward compatibility taken into account
 - Ease of installation and administration (what is the burden on system administrators/users to adopt technology)
 - Acceptance in the engineering community

What Technologies Exist To Produce a “Bio-Grid” (caGRID)

- ▶ Web Services
 - Bio-MOBY
- ▶ Grid Services
 - OGSA-DAI
 - Globus
 - SRB
- ▶ P2P
 - JXTA
- ▶ Hybrid
 - Chinook (Web services and JXTA)
- ▶ Home Grown

Related projects, technologies and standards.

What is needed to make the Grid “Bio-Accessible”?

- ▶ Submit caGRID prototype project to the caBIG - Architecture Workspace for evaluation
- ▶ Increase understanding of grid computing in the biological sciences - caGRID project
- ▶ Produce a “best practices” and “lessons learned” document/presentation for the community to learn from our experiences
- ▶ Provide a forum for users to explain their requirements and pain points

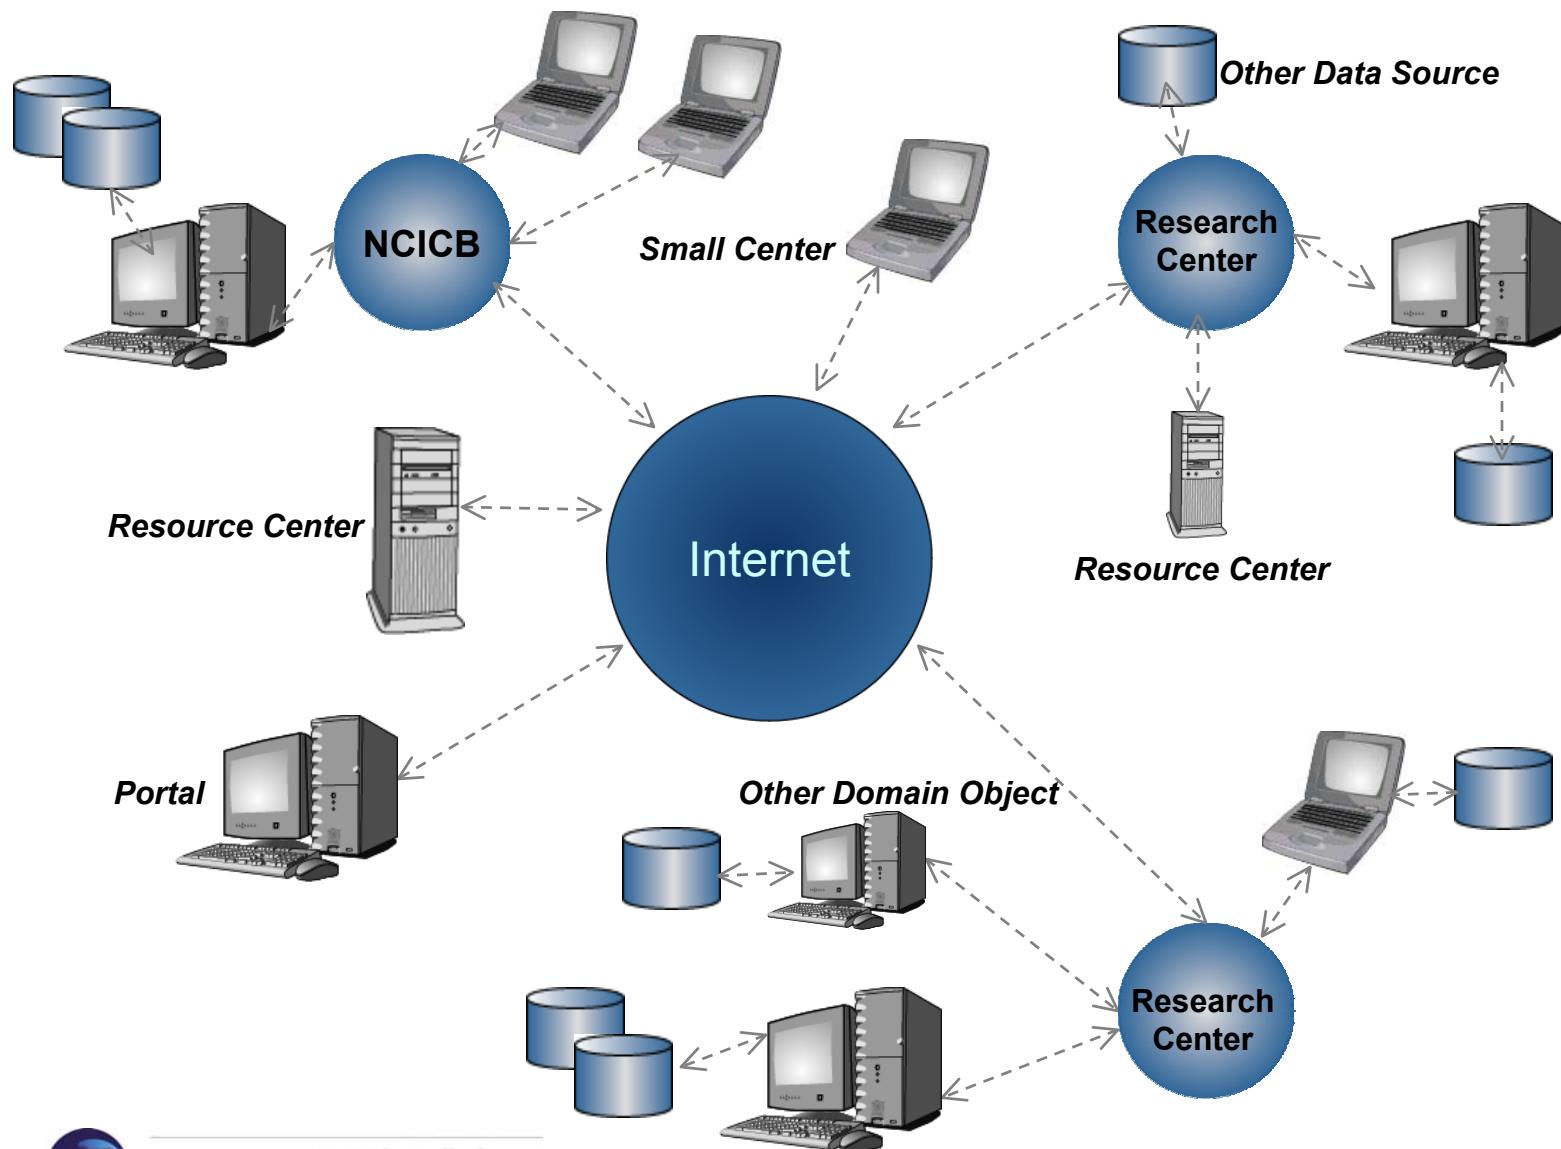

How Do We Realize a Bio-Grid?

- ▶ Provide Semantic representations and intuitive query of Datastores & Services
 - “Computer, find me all clinical trials that are in phase I and are studying neoplasia” vs. “Select * from clinical_trial_data ctd, disease d where ctd.id = d.id and d.desc like ‘%neoplasia%'”
 - Find me all genes and their aliases that are associated with neoplasia
 - Find me all micro-array experiments that have been used in studying neoplasia
 - Find me all pathways that have been implicated in neoplasia
 - Put together a compelling, publishable, “drugable” story based on these queries

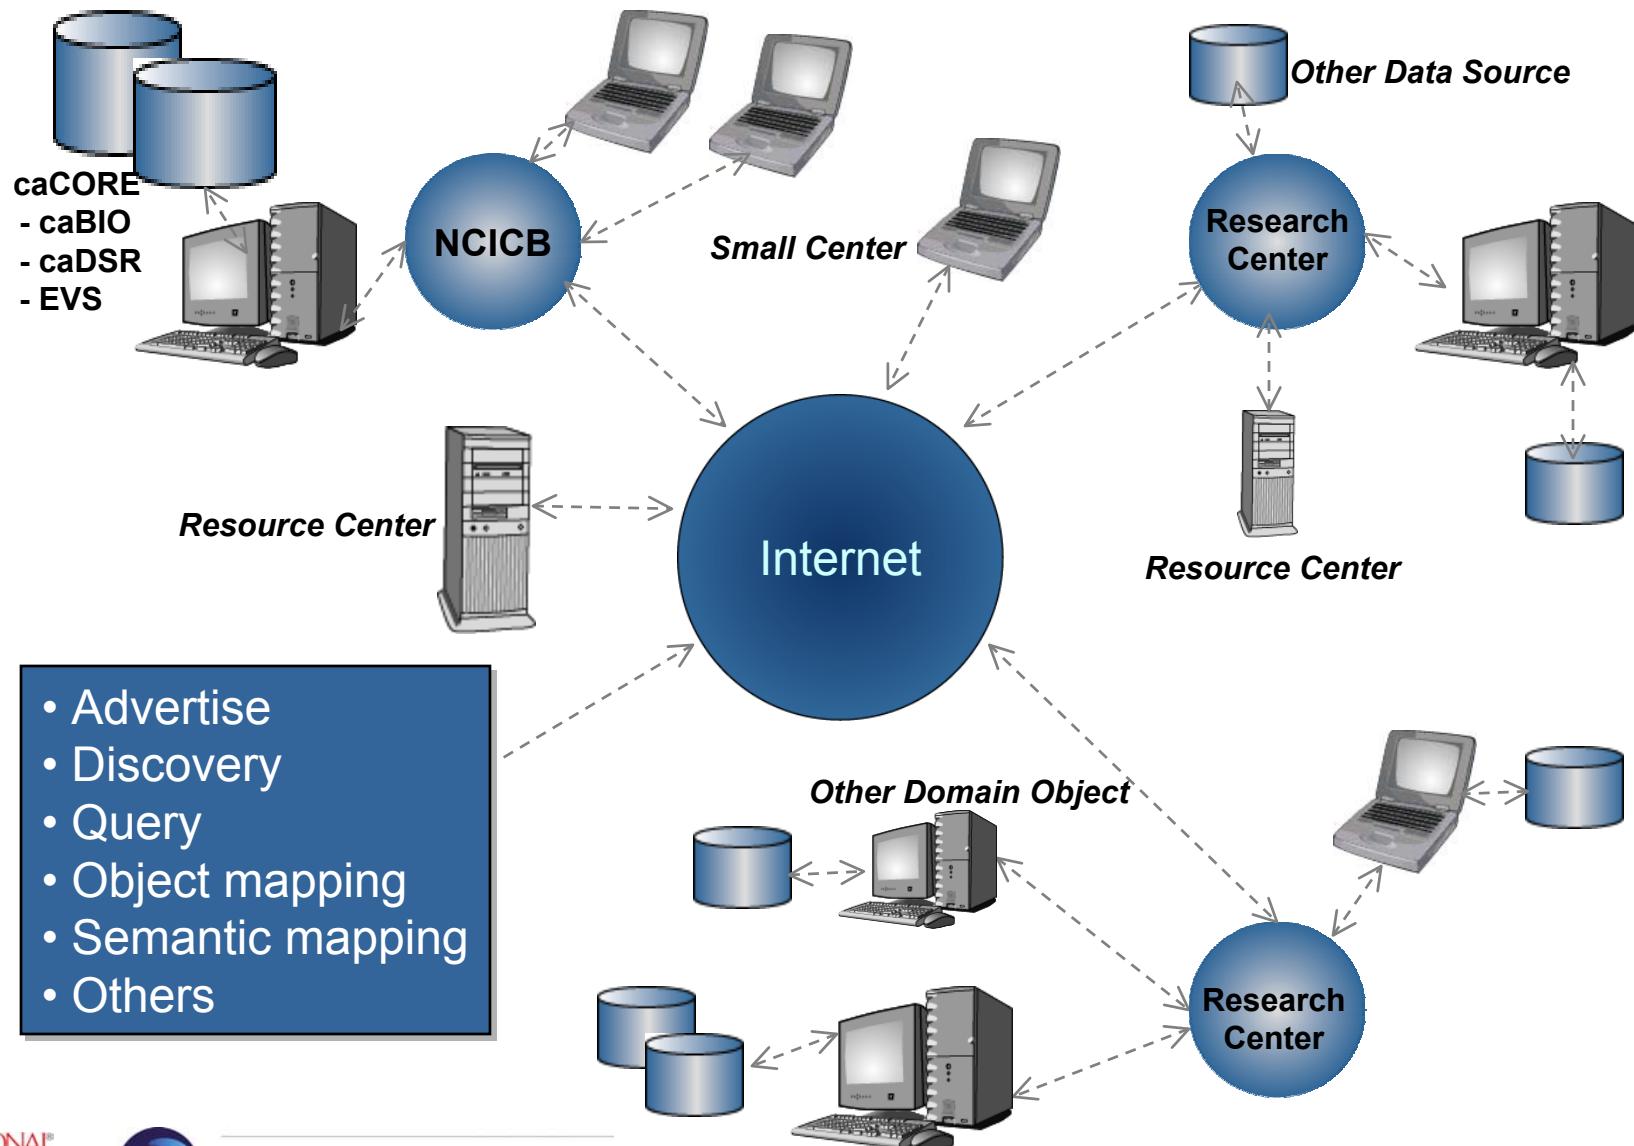

What Did We Choose And Why?

- ▶ Open Grid Services Architecture – Data Access & Integration
(OGSA-DAI)
 - Based on Globus toolkit
 - Large development community
 - Written on top of web services technology
 - Best documentation with updated documents provided upon every release
 - Provides best tradeoff of complexity for ease of development
 - Addition of features is relatively straight forward

Grid requirements

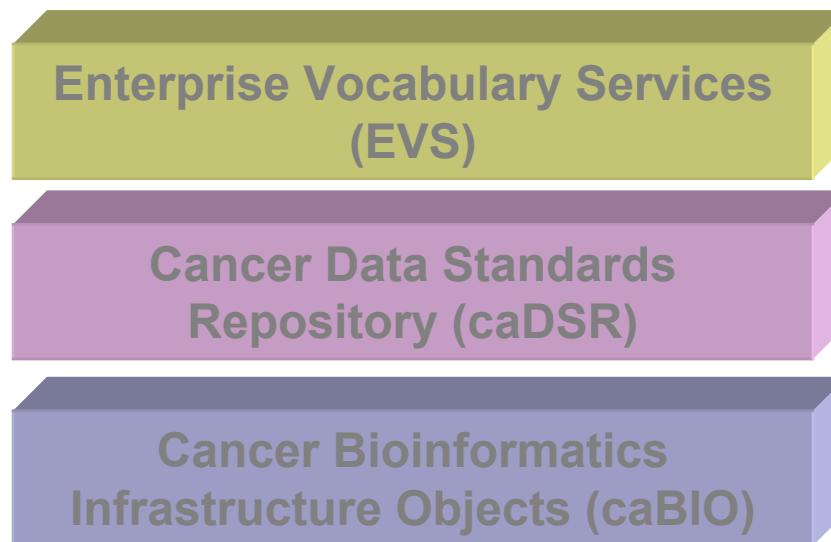

Grid requirements

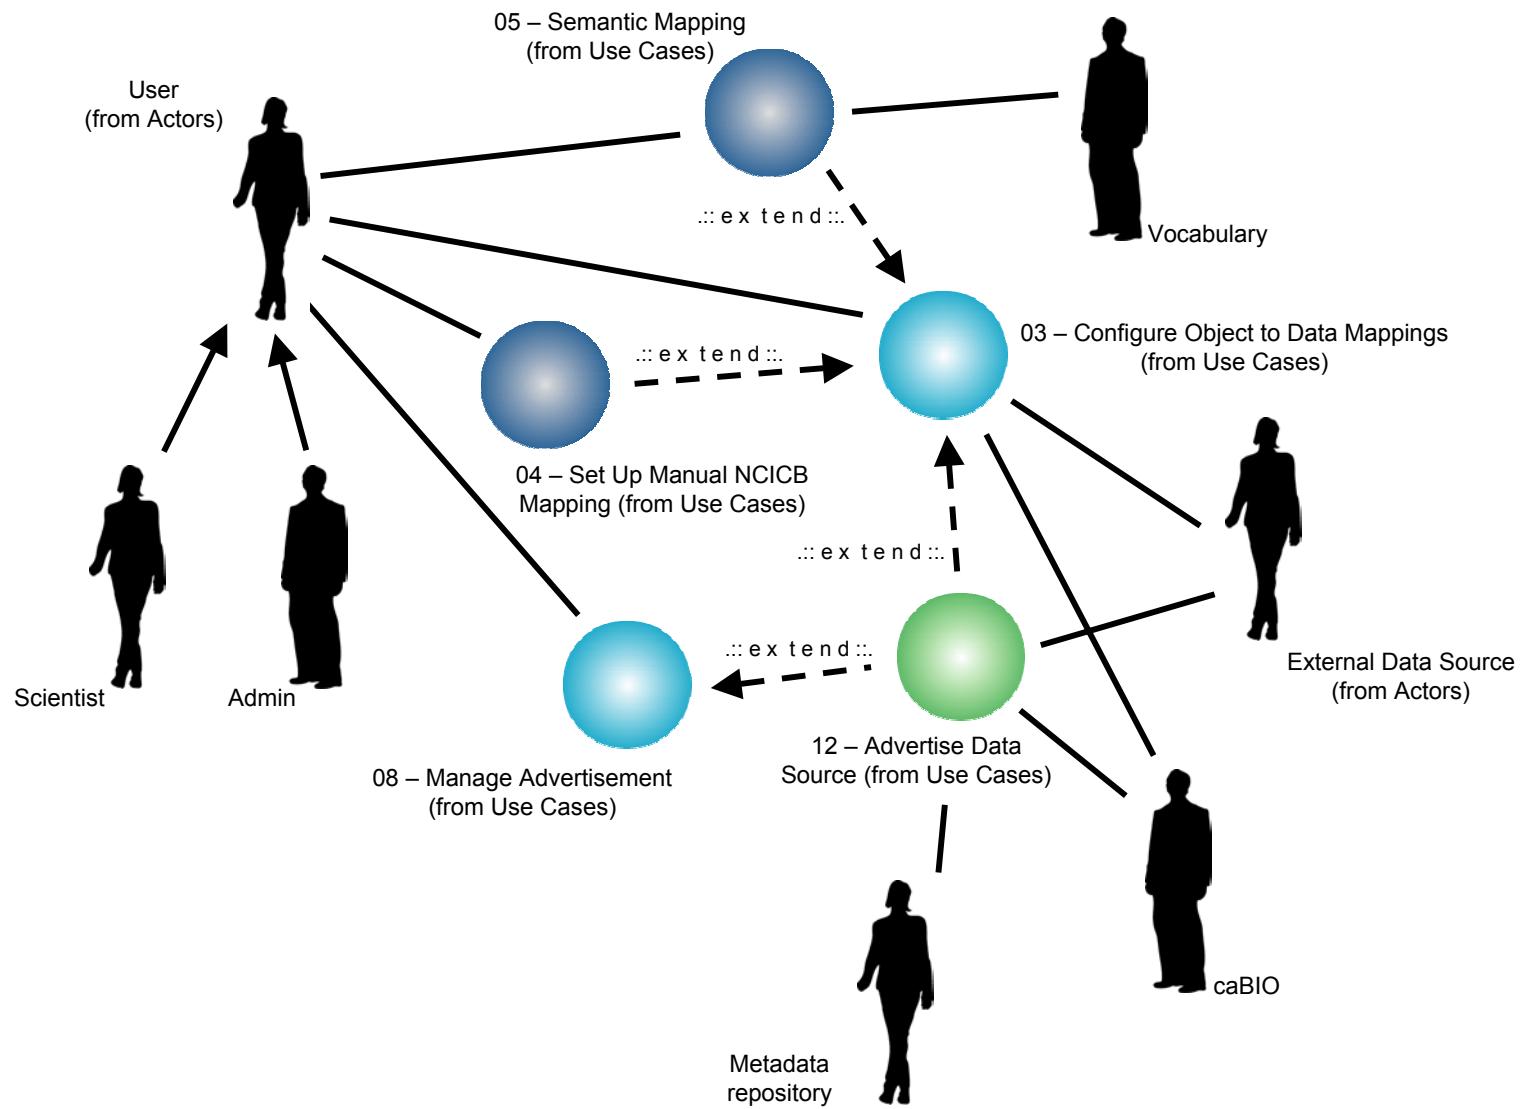

Prototype based on caCORE

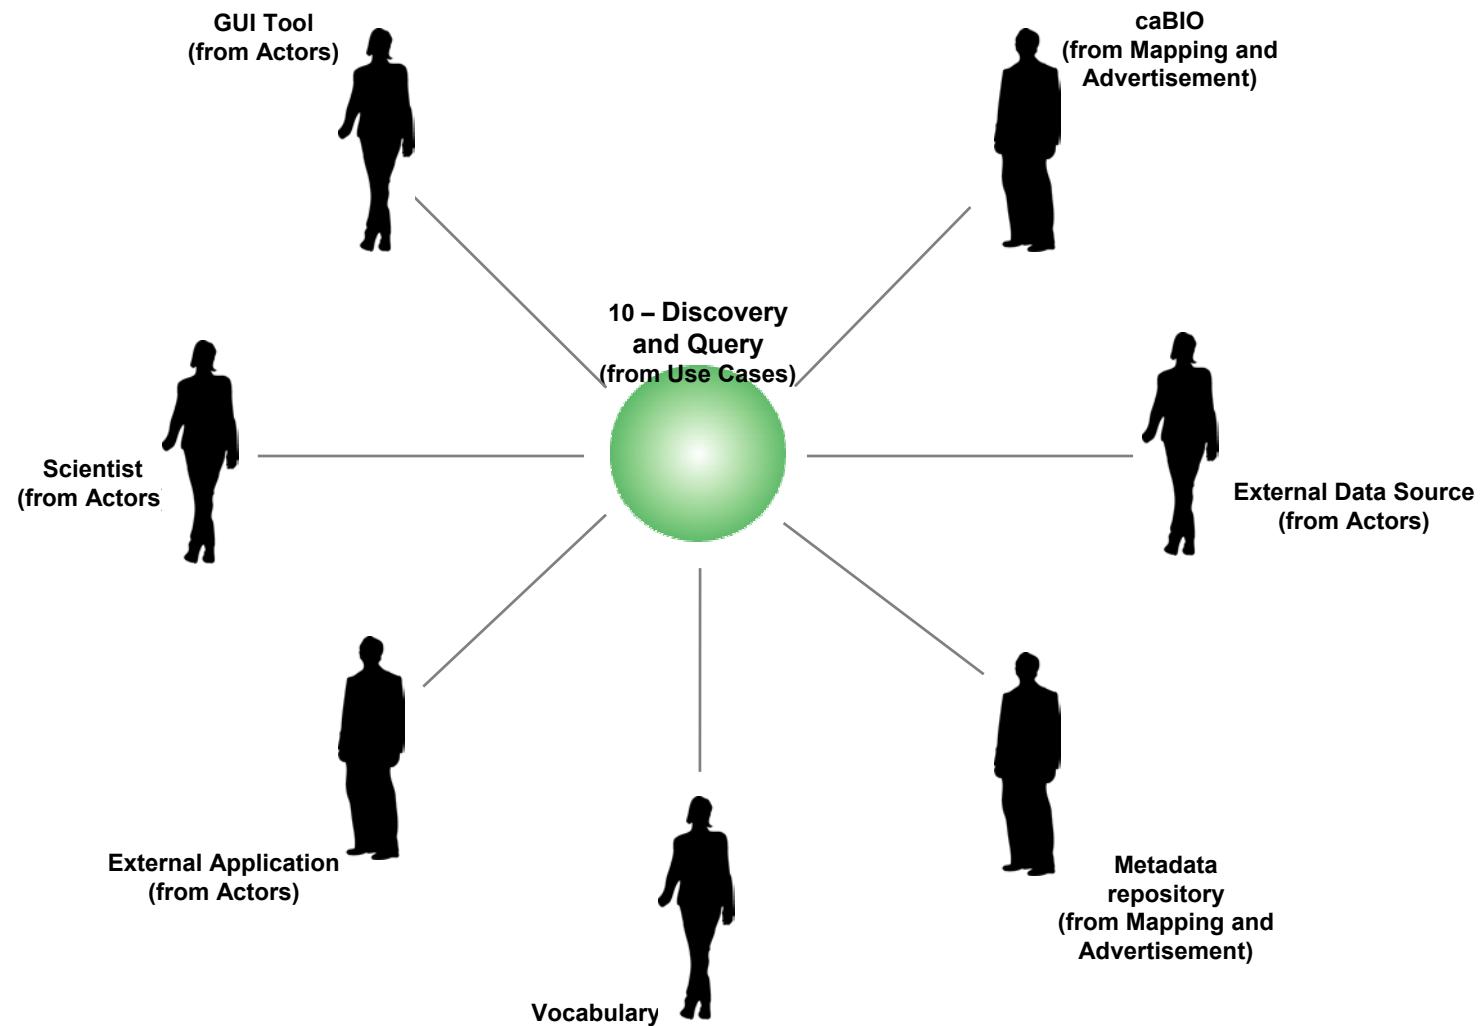

- ▶ **ca**ncer **C**ommon **O**ntologic **R**epresentation **E**nvironment (caCORE)
- ▶ caCORE is the technology stack that facilitates data integration across multiple scientific disciplines

Requirement Prioritization

	Prototype
Goals	<ul style="list-style-type: none">-Query Data and Discovery Service – Full-Advertise services – Command line-Startup – Command line-Shutdown – Command line-Install – Basic
Requirement	<ul style="list-style-type: none">-Define and prioritize requirements-Perform technology evaluation (Grid, Semantics)-Define architecture-Implement prototype – caBIO-Semantics - service level-Test GRID technology/framework

Preliminary Architecture

Significant Use Case vs. Candidate Technologies

	Advertise	Discovery	Query	Object Mapping	Semantic Mapping
Web services	-UDDI -Extend UDDI. -Create a WS / server code.	-UDDI -Extend UDDI. -Create a WS / Server code.	- caBIO web services.		
Globus, OGSA-DAI, DQP	-Instantiate a grid service. -Registry new service. -Notification -Metadata Framework	-Indexing services (service data providers, data aggregators, grid service registry).	-Object model / caBIO java api. -Data bases (RDB, XML)		
SRB	- MCAP / Metadata service.	- MCAT / Metadata service.	- SRB server / FS, DB, Obj.		
Jena2	- Improve service description.	- Improve service discovery.			-RWU Ontology languages. -Representation of semantic obj.
MCS / caDSR	- Metadata service	- Metadata service			
- OJB				Customize xml representation to model other DB.	

OGSA and Globus Toolkit 3

- ▶ **OGSA**: Open standard architecture for next generation grid-services to enable the creation, maintenance, and integration of grid services maintained by virtual organizations.
- ▶ **OGSI**: A core component of OGSA, which provides a uniform way to describe grid services and defines a common pattern of behavior for all grid services. In short, this architecture defines grid service behaviors, service description mechanism, and protocol binding information by using web services as the technology enabler.
- ▶ **Virtual Organizations**: Coordinated resource sharing and problem solving in dynamic, multi-institutional organizations. sharing is with direct access to computers, software, data, and other resources by a range of collaborative problem solving and resource brokering strategies. The sharing is controlled with resource providers and consumers defining what is shared, who is allowed to share and the conditions under which sharing occurs. The set of individuals and/or institutions defined by the sharing rules from the virtual organization.
- ▶ **GT3**: The Globus software technology toolkit version 3 is the major reference implementation of the OGSI standard.

The OGSA-DAI project is concerned with constructing middleware to assist with access and integration of data from separate data sources via the grid. It is engaged in identifying the requirements, designing solutions and delivering software that will meet this purpose. The project was conceived by the [UK Database Task Force](#) and is working closely with the Global Grid Forum [DAIS-WG](#) and the [Globus Team](#).

OGSA-DAI is a UK [DTI Funded](#) e-Science Grid Core Project involving the following partners:

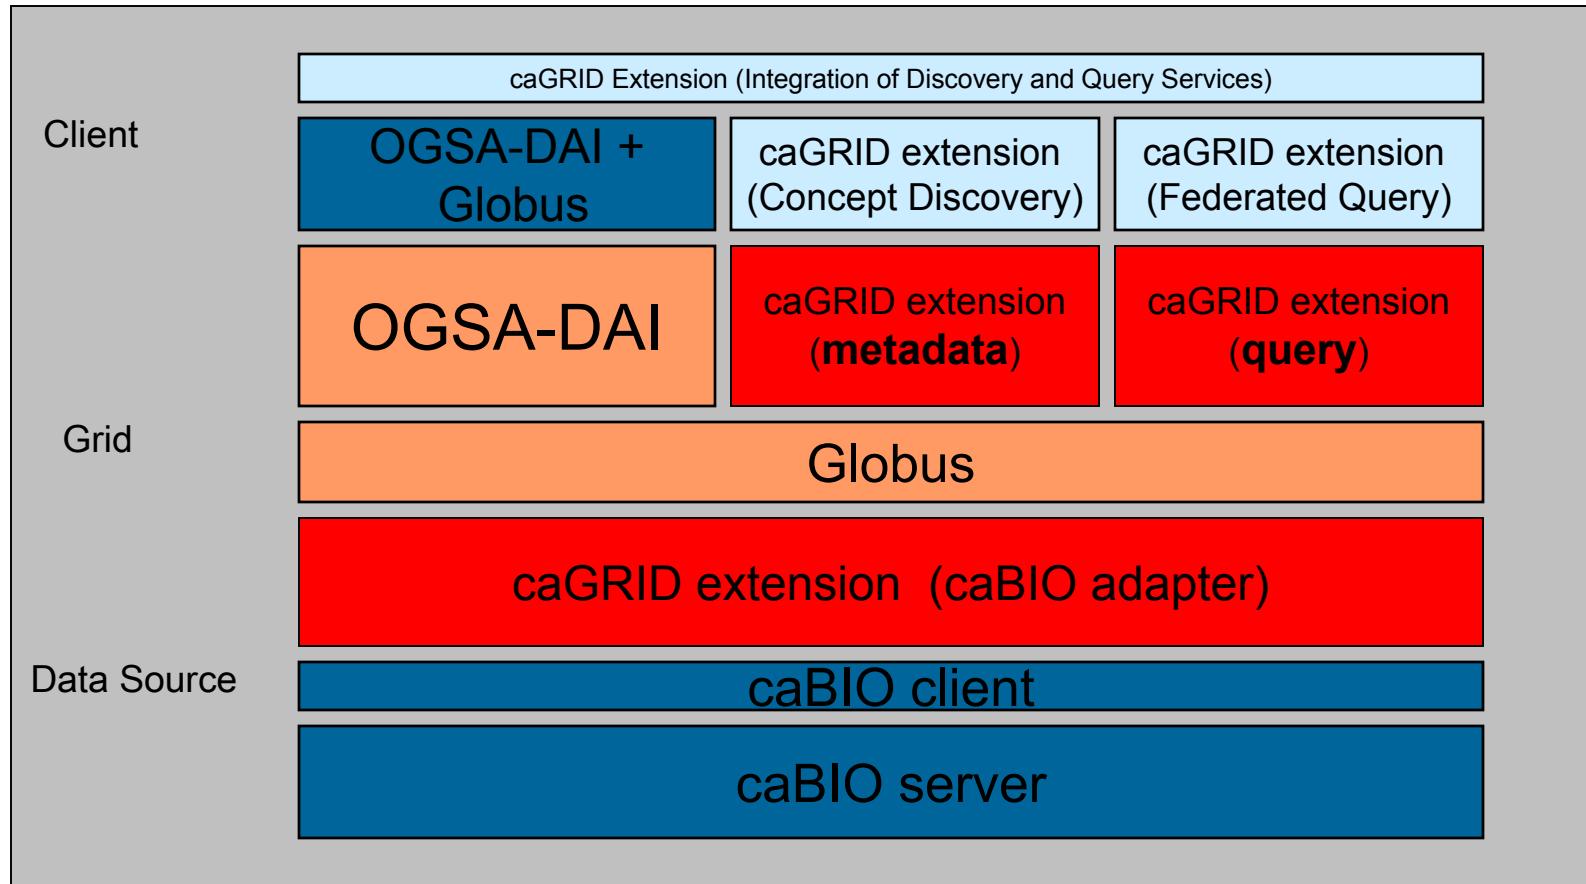

|epcc|

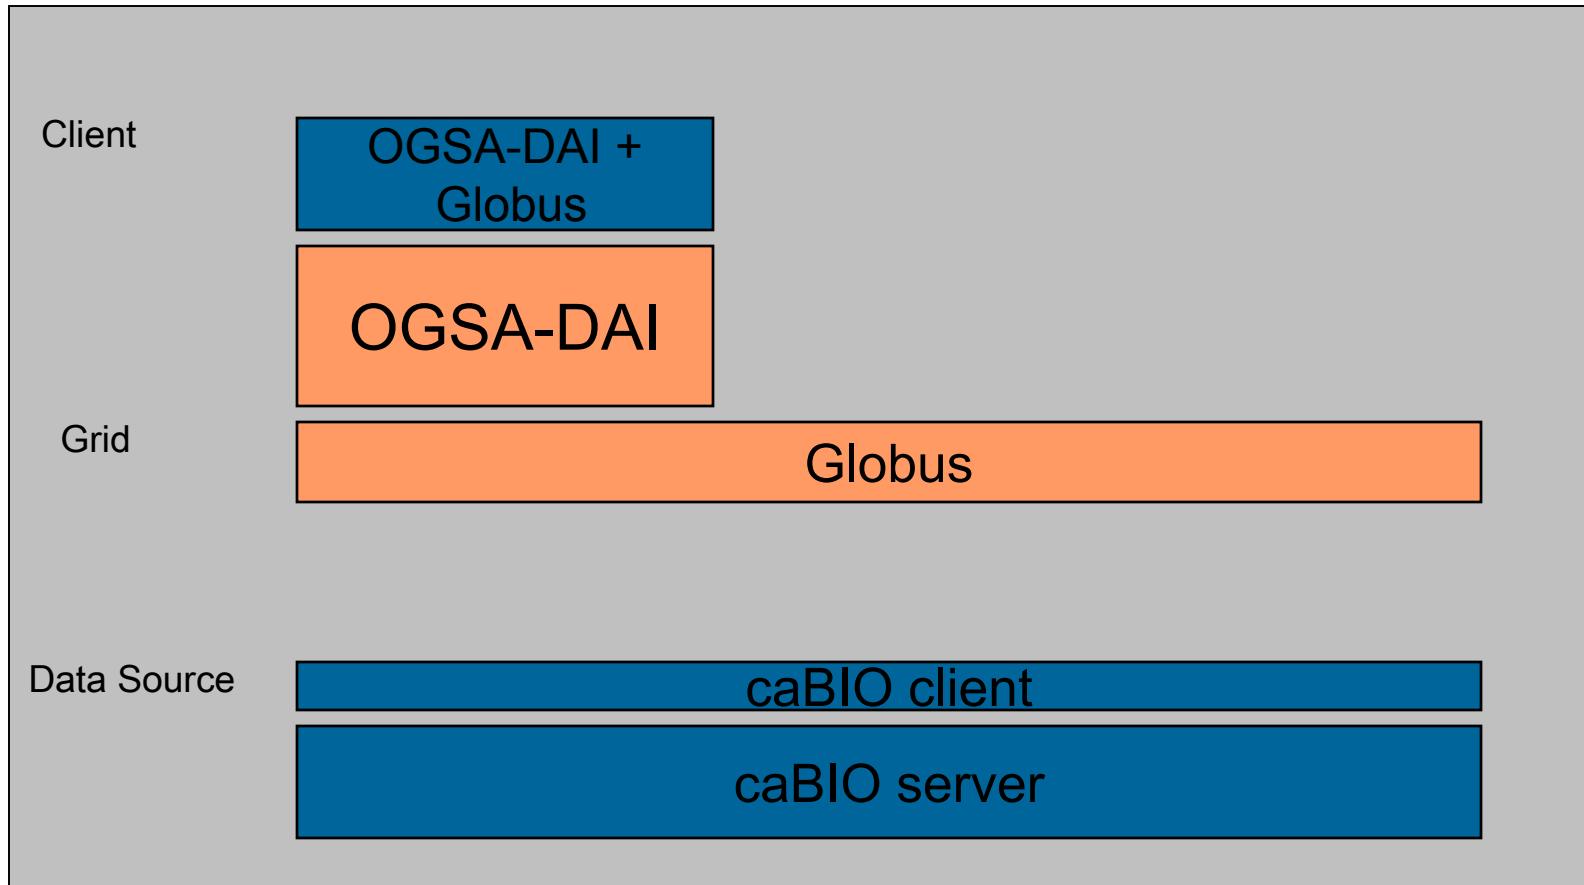

ORACLE

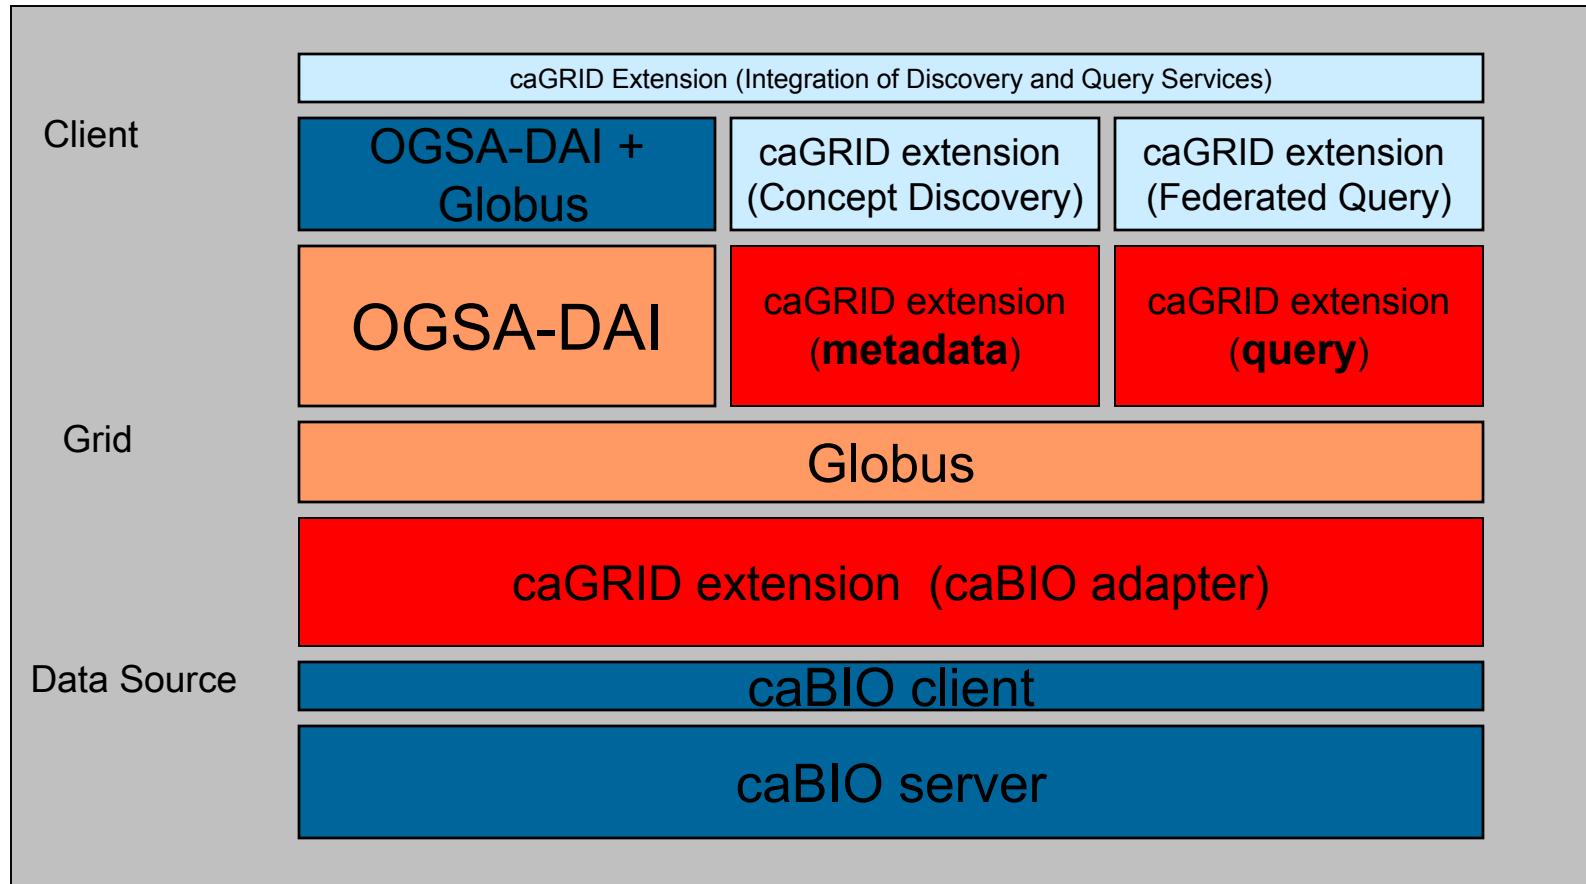

caGRID Core architecture

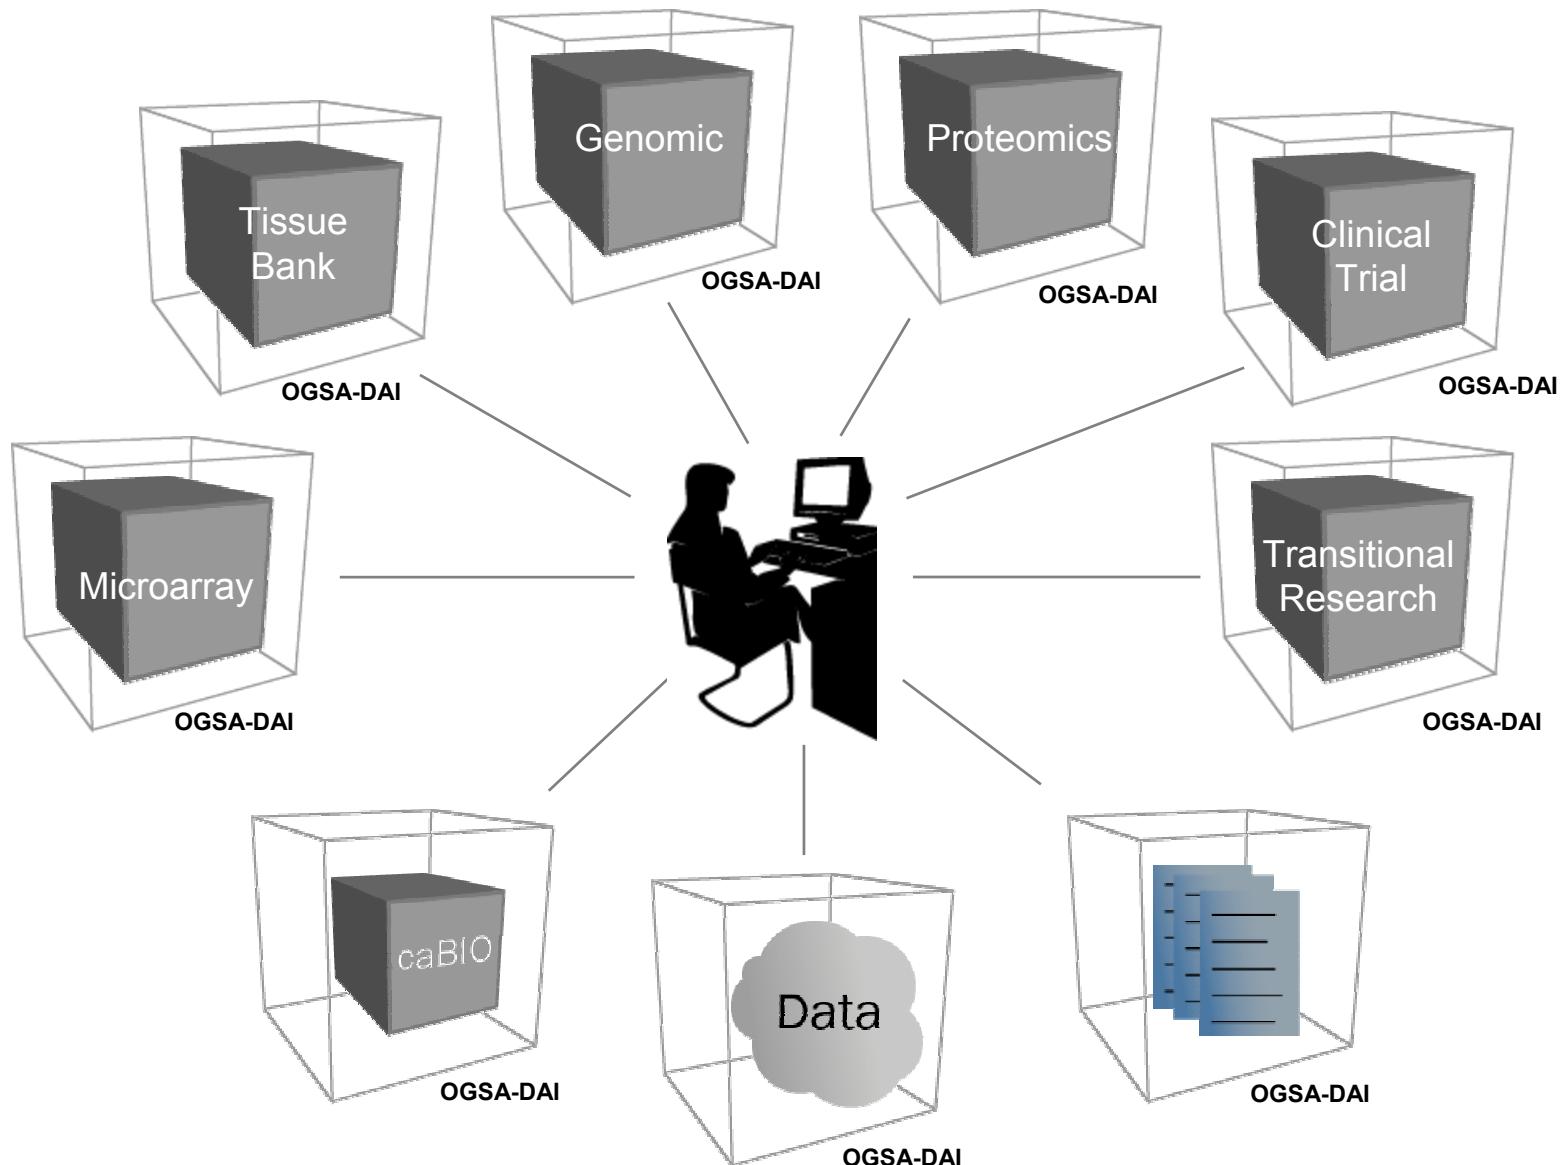

caGRID Core architecture

caGRID Core architecture

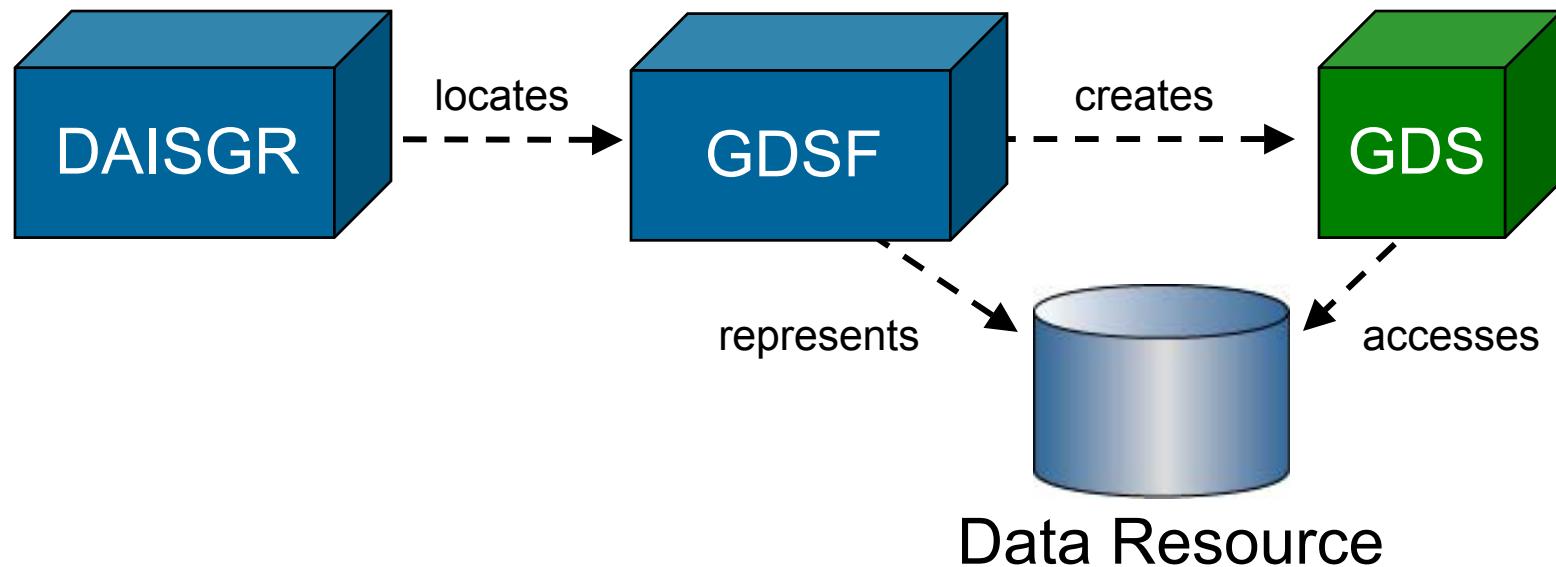

Facilitating data access

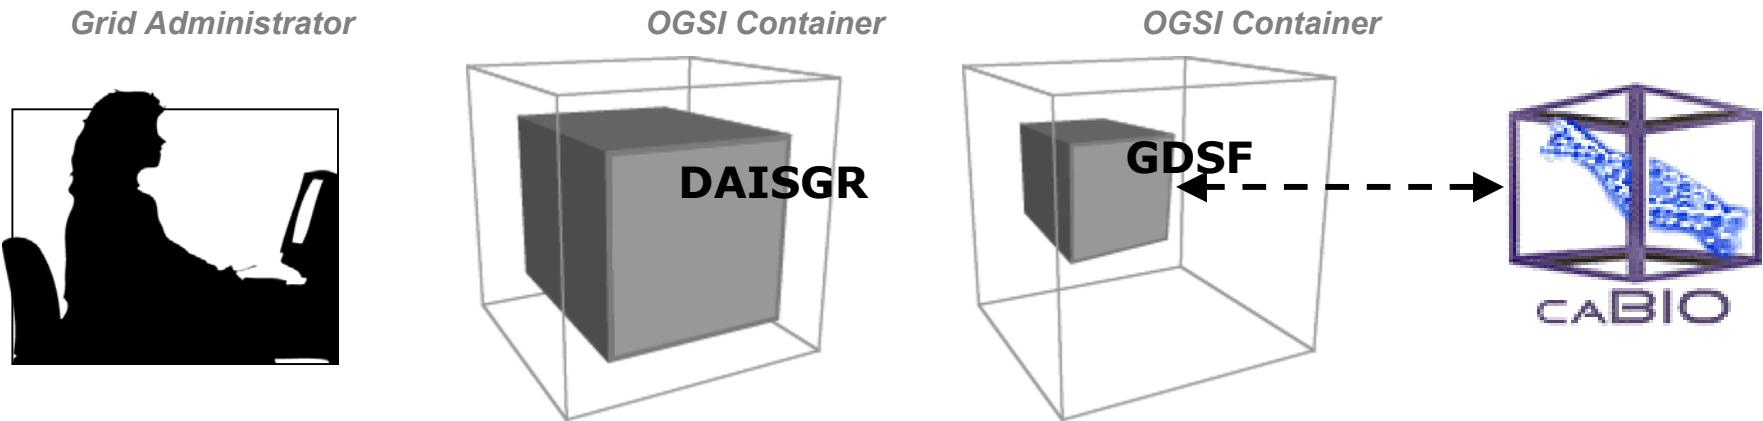

OGSA-DAI Services

- ▶ OGSA-DAI uses three main service types
 - Data Access & Integration Service Group Registry (DAISGR) for discovery
 - Grid Data Service Factory (GDSF) to represent a data resource
 - Grid Data Service (GDS) to access a data resource

Interaction Model: Start up

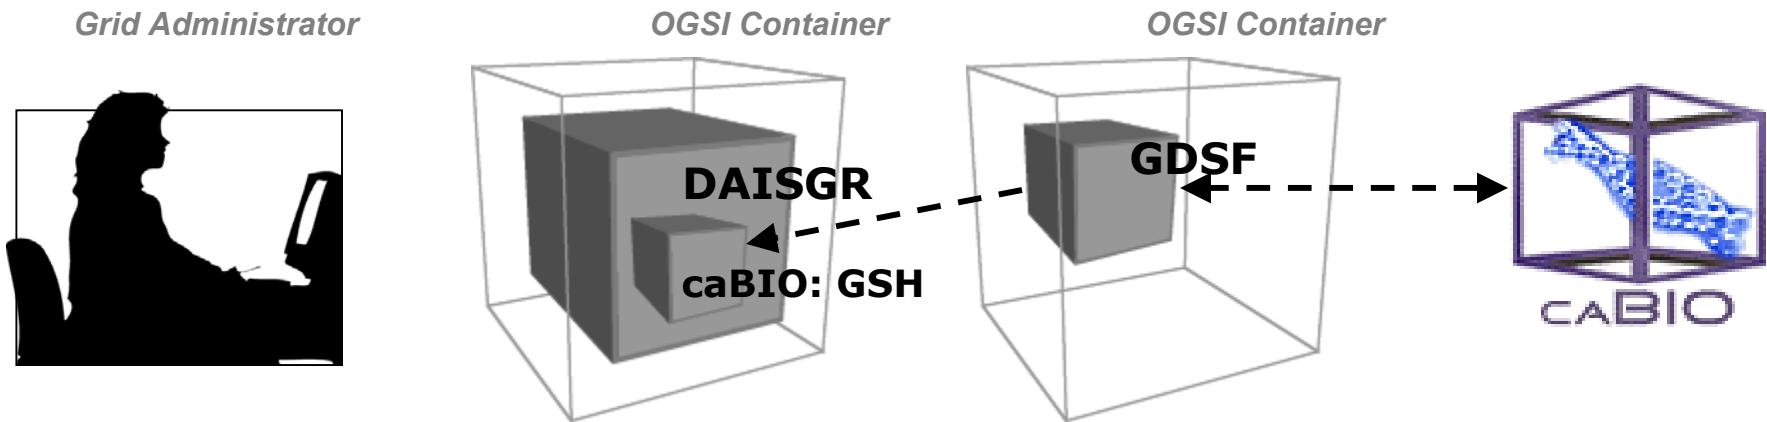

1. Start OGSI containers with persistent services.
2. Here GDSF represents caBIO database.

- DAISGR (registry) for discovery
- GDSF (factory) to represent a data resource
- GDS (data service) to access a data resource

Interaction Model: Registration

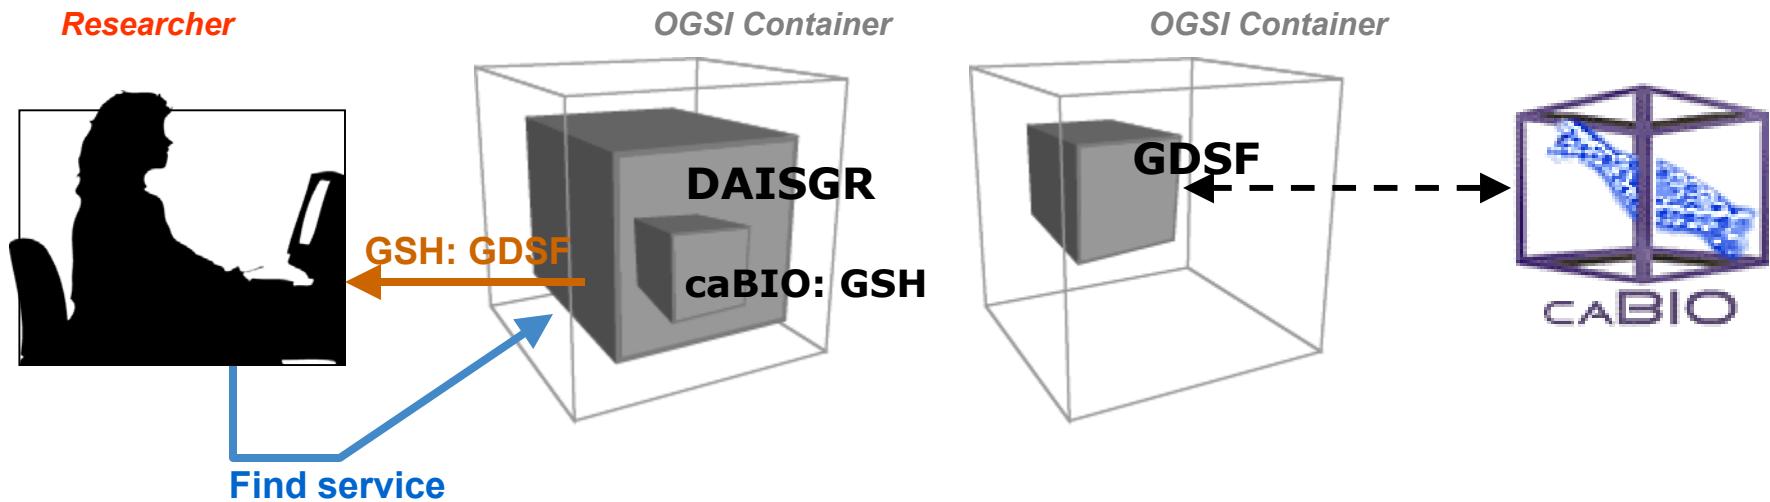

3. GDSF registers with DIASGR

- DAISGR (registry) for discovery
- GDSF (factory) to represent a data resource
- GDS (data service) to access a data resource

Interaction Model: Discovery

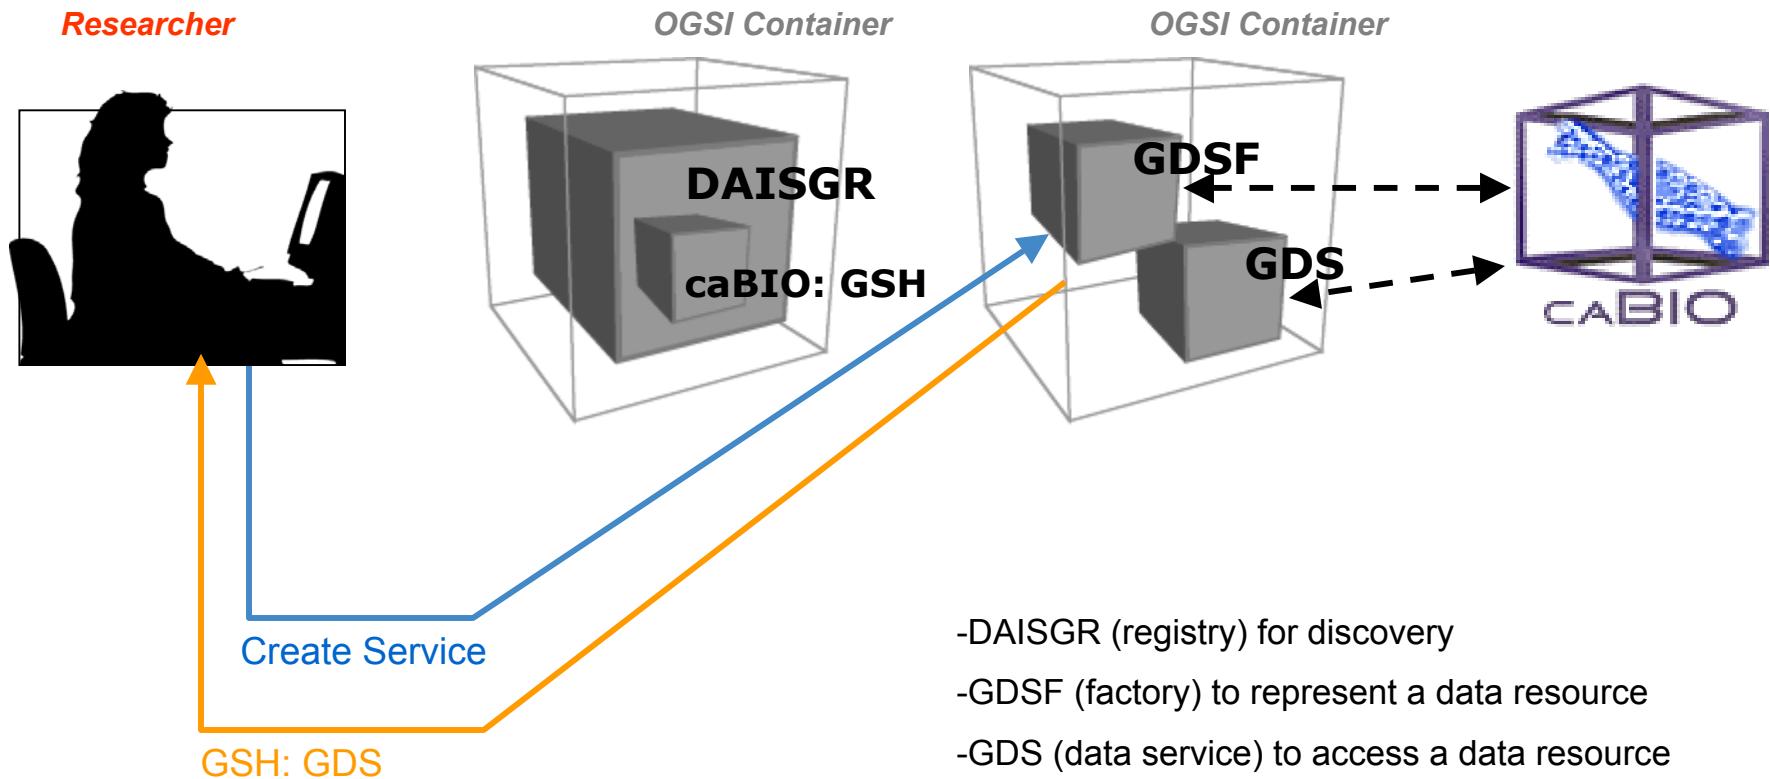

4. Client wants to know about caBIO. caBIO can...
 - (i) Query the GDSF directly if known or
 - (ii) Identify suitable GDSF through DAISGR.

- DAISGR (registry) for discovery
- GDSF (factory) to represent a data resource
- GDS (data service) to access a data resource
- Grid Service Handler (GSH)

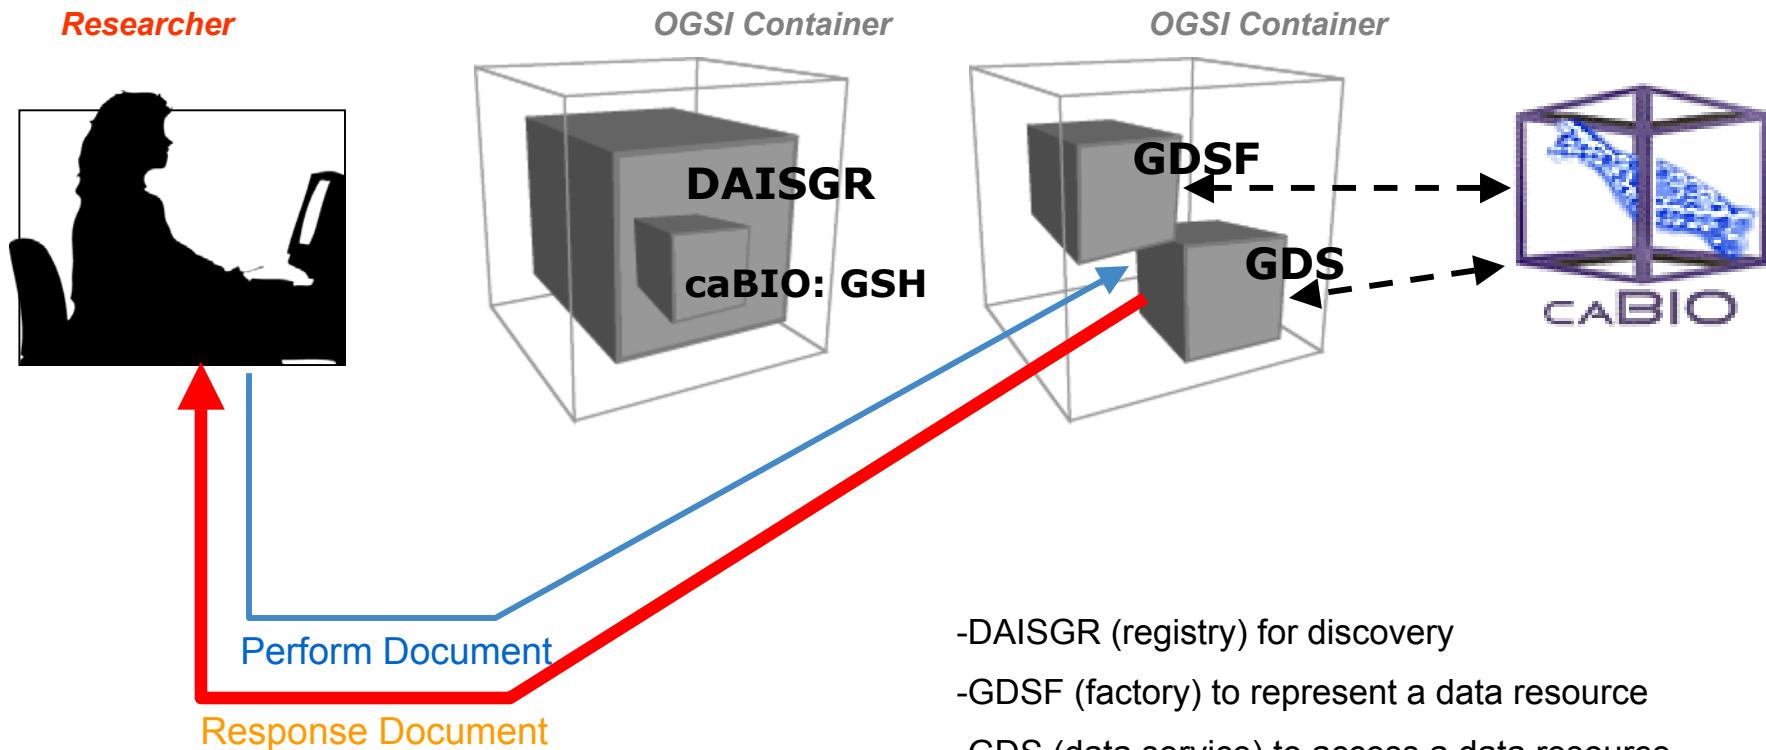

Interaction Model: Service Creation

- Having identified a suitable GDSF client asks a GDS to be created.

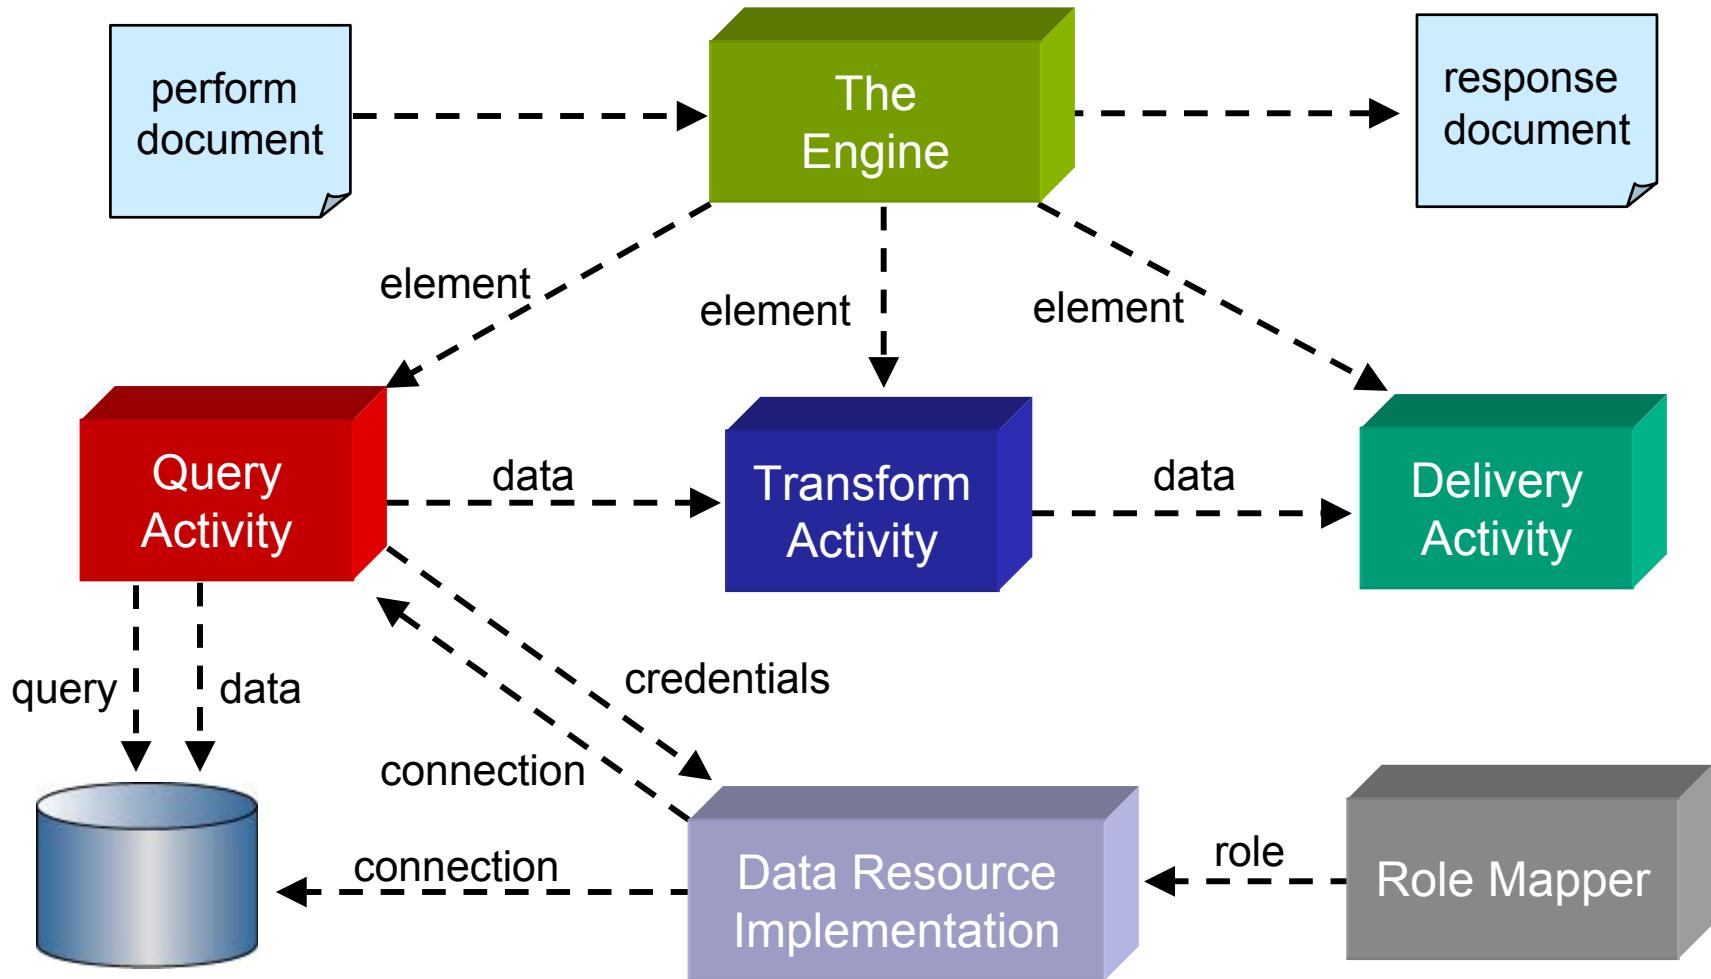

Interaction Model: Perform

6. Client interacts with GDS by sending Perform documents.
7. GDS responds with a Response document.
8. Client may terminate GDS when finished or let it die naturally.

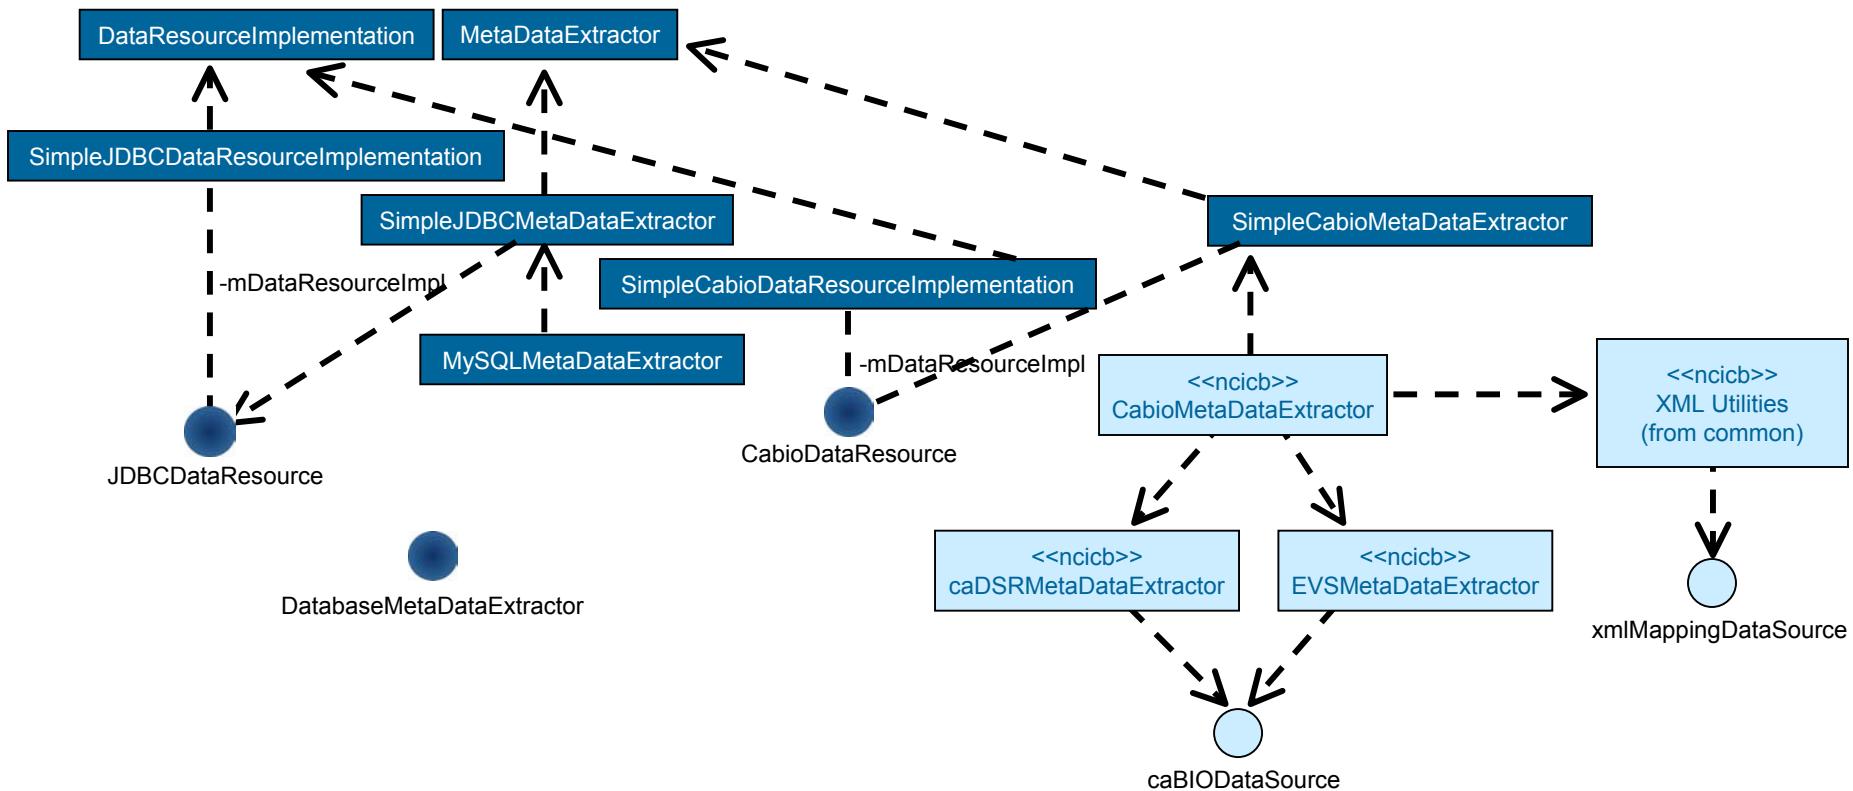

GDS Internals

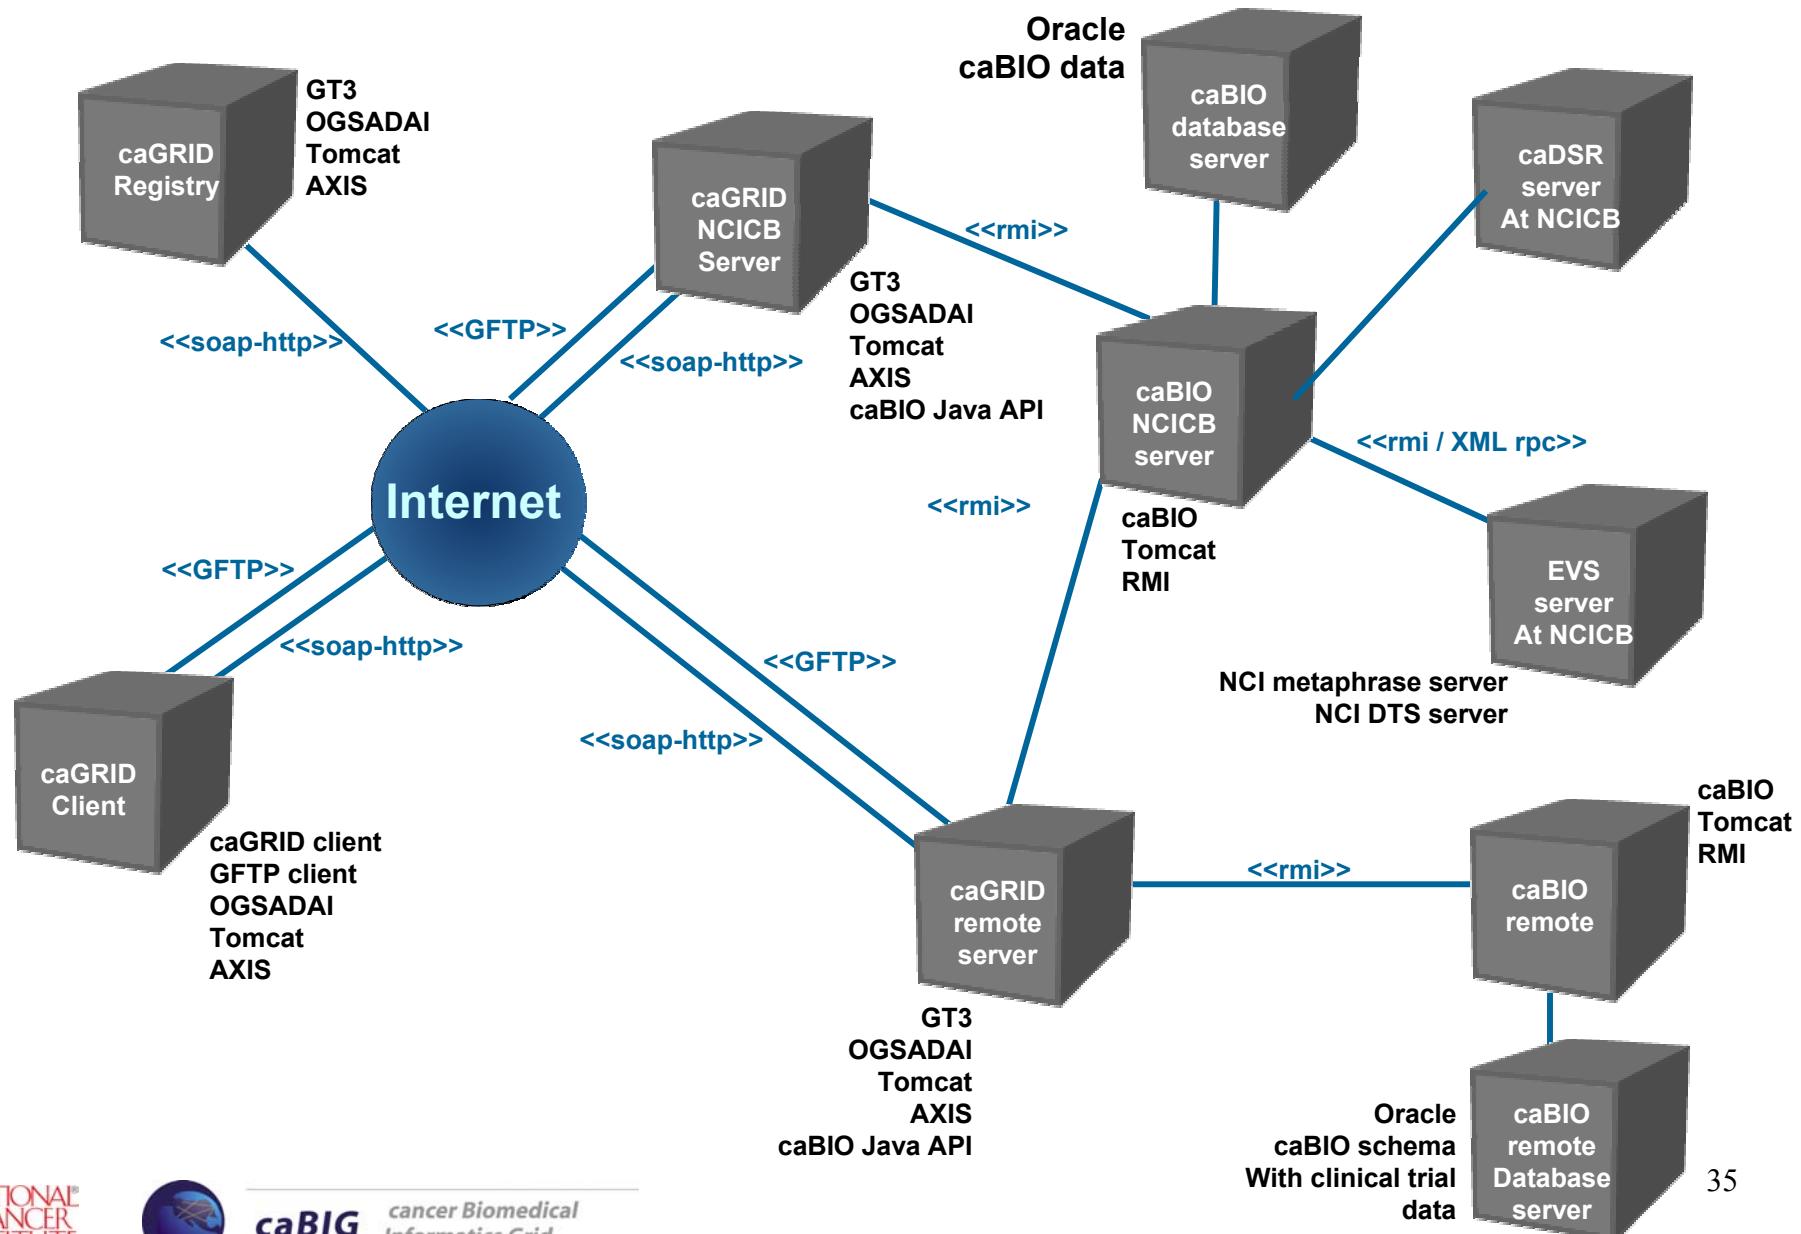

OGSA-DAI Extensions

- ▶ **New data source:** caBIO added as a new data source to the OGSA-DAI framework.
- ▶ **Activities:** Two activities that implements caBIO Java api.
- ▶ **Local caDSR:** Local xml representation of caDSR.
- ▶ **Query language:** Prototype query language with XML representation to query caBIO data source.
- ▶ **Metadata:** 2 new metadata categories added (caBIOSchema and ResearchCenterInformation). Includes the caDSR/EVS metadata extractor.
- ▶ **Concept Discovery:** Client extended to discover by concept name in the grid. The result set is the factories grouped by relationships.
- ▶ **Federated query:** Federated query by relationship (from discovery process). Send serialized queries to the factories that have advertised concept-relationship.
- ▶ **Sample Implementation:** A command line application that integrates Discovery and Query extension. The application help the user to perform discovery and federated queries.
- ▶ **Result set cached (Alpha):** The result set from a federated query will be store in a client xml database. Using another factory the result set can be query using xpath expressions.
- ▶ **Metadata query (Alpha):** ability to query metadata without using xpath expression.

Datasource – GDSF – Framework extension

Deployment Diagram (Prototype)

Prototype Demo

- ▶ Globus GUI – Grid service concept,
 - Registry
 - Metadata
 - Metadata Query
 - caBIOConfig
- ▶ OGSA-DAI GUI
 - Instantiate a factory
 - Submit perform documents
 - Show perform Documents
- ▶ Client and Client extensions
 - Add/Remove services
 - Discovery process
 - Clinical trial protocol, Diseases
 - Query services
 - Show me all phase I Clinical Trial Protocols
 - Show me all Trials for Neoplasia
 - Show me all Diseases that are associated with Phase I trials.
 - Sample using the caBIG middleware.

Demo starts here ...

Lesson Learned

- ▶ There is an inherent learning curve in implementing grid technologies
- ▶ Grid technologies are still maturing and preparation for frequent upgrades is essential
- ▶ Common meta data structure and terminology is necessary to effectively describe services and data
- ▶ A common query language is important to support federated queries

Future Recommendations

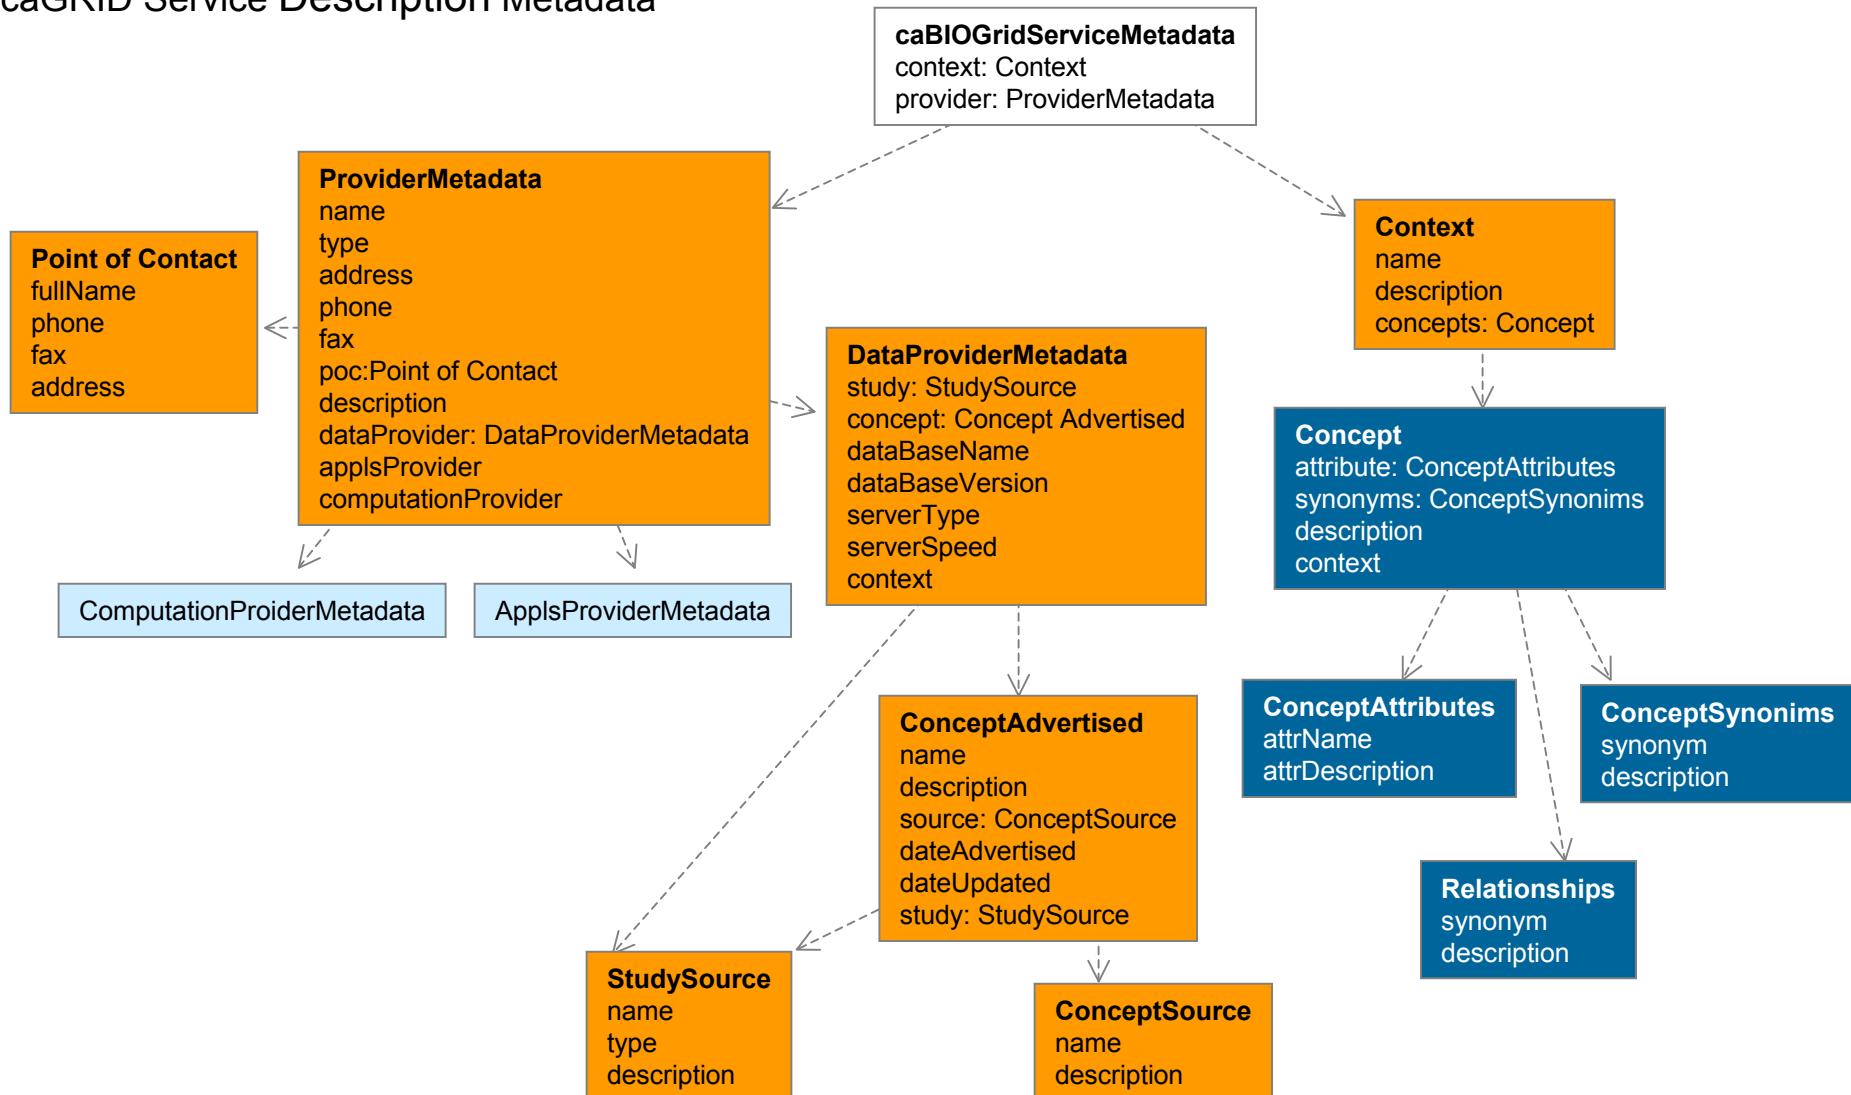

- ▶ Map existing use cases to caBIG needs
- ▶ Continue extending caGRID to produce a robust platform. Extensions include:
 - Upgrades to the latest version of Globus in support of web services standards
 - Design and implementation of user friendly GUI query tools
 - Implementation of additional grid services including
 - Security
 - File Sharing
 - Enhance strategy for semantic web interoperability
- ▶ Document caGRID efforts
 - Draft a white paper describing evaluation and prototype efforts
 - Draft developer guides to assist in establishing grid connections

        SearchResult sr = SearchCriteria.copyDownCastSR( sc.search(), SearchResult.class );
        mOutput.put(XMLUtility.makeXMLStringDoc( sr, heavy ));

    } catch (Exception exc) {
        System.out.println("Test failed in the main of GeneDemo.java: " + exc.getMessage());
        exc.printStackTrace();
    }
    mOutput.close();
    setCompleted();
}
```

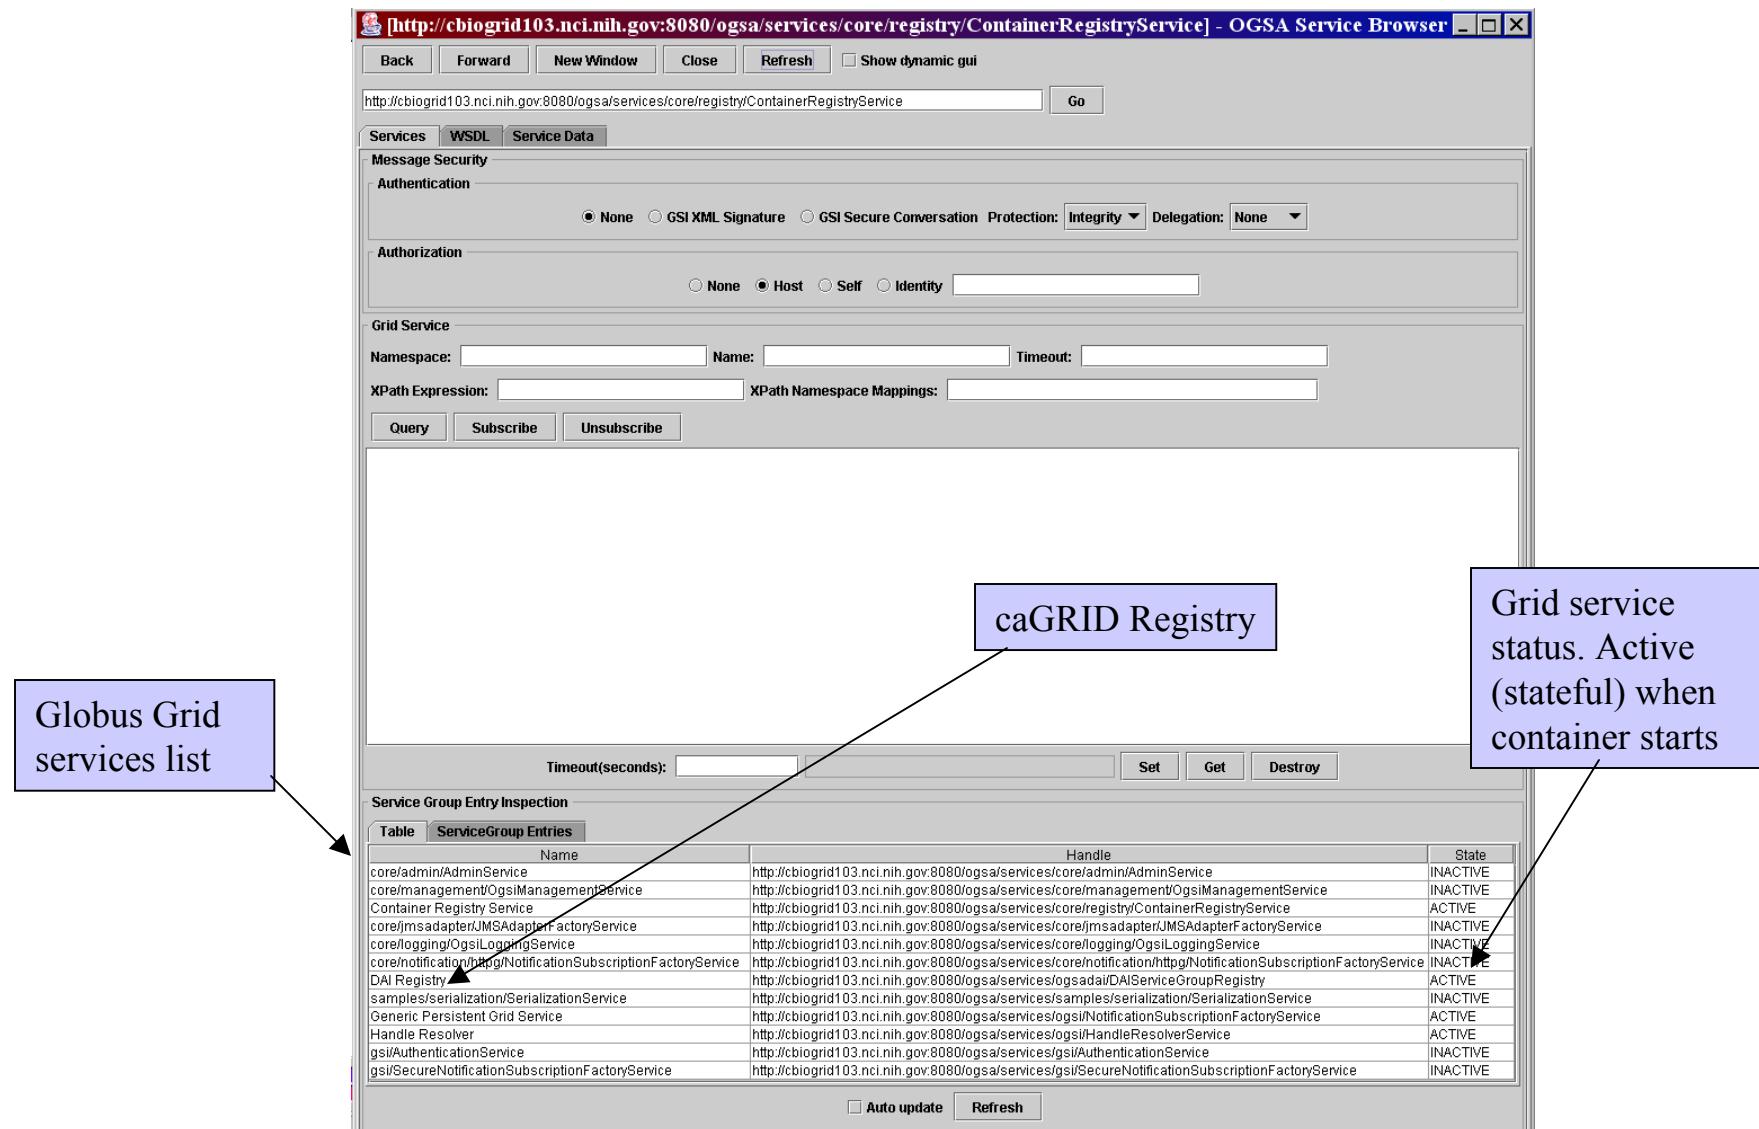

Prototype Scenario Setup

Screen Shots

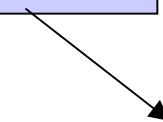

caGrid – Globus GUI

caGRID Registry

The screenshot shows the OGSA Service Browser interface. At the top, there are buttons for Back, Forward, New Window, Close, Refresh, and a checkbox for Show dynamic gui. Below that is a search bar with the URL http://cbiogrid103.nci.nih.gov:8080/ogsa/services/ogsadai/DAIServiceGroupRegistry and a Go button. The main area has tabs for Services, WSDL, and Service Data. Under Message Security, it shows Authentication (None selected) and Authorization (Host selected). Under Grid Service, it shows Namespace, Name, and Timeout fields, along with XPath Expression and XPath Namespace Mappings. Below these are buttons for Query, Subscribe, and Unsubscribe. A large text input field is present. At the bottom, there are buttons for Timeout(seconds), Set, Get, and Delete. A section titled Service Group Entry Inspection contains a table with columns for Name and Handle, listing several service entries. At the bottom, there are Auto update and Refresh buttons, and a Registry section with Handle fields for Unregister and Register.

This factories represent the services advertised from Research centers

- Research centers can register services (factories) when their container starts or any time using Globus client.
- Service can have a lifetime.
- Services can be removed any time.
- Services can belong to different registries.

caGRID Factory

The screenshot shows the 'caGRID Factory' interface for querying services. A purple box labeled 'Factory' points to the title bar. Another purple box labeled 'Standard way to query about services. Same queries using globus client' points to the left side of the interface. A third purple box labeled 'Query for Metadata category' points to the 'Name:' field containing 'productInformation'. A fourth purple box labeled 'productInformation (ogsadai) expanded' points to the expanded XML result tree.

Cbiogrid102 represents NCICB grid node which advertised all concepts from caBIO object model

Metadata – GENE_EXPRESSION

Each dataElementConcept includes:

- Concept description.
- Concept attributes
- Concept relationships

The screenshot shows a web-based interface for viewing metadata. At the top, there is a header bar with a user icon, the URL [http://cbiogrid102.nci.nih.gov:8080/ogsaservices/ogsadai/NCICB_caBIODataServiceFactory] - OGSA Service B..., and standard window controls (Window, Close, Refresh, Show dynamic gui). Below the header is a search bar with the text "ogsaservices/ogsadai/NCICB_caBIODataServiceFactory" and a "Go" button. The main content area is titled "Values" and displays a hierarchical tree view of the GENE_EXPRESSION concept. The tree includes nodes for preferredName (labeled "GENE_EXPRESSION"), preferredDefinition (labeled "CL0017262 The transcription of genetic information into a message and the subsequent translation into a functional protein."), longName (labeled "Gene_Expressions"), version (labeled "1.0"), dateModified, dateCreated, publicId, evs-synonym (with entries for "EXP", "Expression", and "Gene Expression"), and several DataElementConcepts with IDs such as AB566958-92FF-5A46-E034-0003BA12F5E7, AB55AC96-76E5-5A42-E034-0003BA12F5E7, C43EA872-F67A-12DC-E034-0003BA12F5E7, etc. A large arrow points from the text "Each dataElementConcept includes:" towards the "Attributes and relationships from GENE_EXPRESSION concept" section.

Each research center advertised the concepts desired. The concept list can be obtained from NCICB metadata, caGRID client extension and in the future using a GUI

Attributes and relationships from GENE_EXPRESSION concept (details next slide)

Attributes and Relationships

Attributes

Relationship

Screenshot of OGSA Service Browser showing service data for Panther1_caBIODataServiceFactory.

The browser interface includes a header with Back, Forward, New Window, Close, Refresh, and a checkbox for "Show dynamic gui". The URL is http://jforge.net:8080/ogsa/services/ogsadai/Panther1_caBIODataServiceFactory.

The "Service Data" tab is selected, displaying a table of service operations:

Name	PortType	Type	Min	Max	Mutability	Modifiable	Nillable
setServiceExtensibility	(http://www.gridfor...)	(http://www.gridfor...)	1	unbounded	static	false	false
terminationTime	(http://www.gridfor...)	(http://www.gridfor...)	1	1	mutable	false	false
createServiceExtensibility	(http://www.gridfor...)	(http://www.gridfor...)	1	unbounded	static	false	false
productInformation	(http://ogsadai.or...)	ProductInfoType	0	1	mutable	false	false
researchCenterInformation	(http://ogsadai.or...)	ResearchCenterIn..._0	0	1	mutable	false	false
caBioSchema	(http://ogsadai.or...)	(http://www.gridfor...)	0	1	mutable	true	false

The "Values" section displays the structure of a DataElementConcept:

OGSA-DAI Client - Registry

The screenshot shows the OGSA-DAI Graphical Client Demonstrator v1.0 interface. At the top, there's a menu bar with File, View, and Help. Below the menu is a toolbar with icons for DAISGR Input Console, Try DAISGR Console, and DAISGR Output Console. A large blue box labeled "caGrid Registry" covers the left side of the interface. Inside this box, another blue box labeled "Services advertised" contains a list of service URLs. One URL, "http://cbiogrid101.nci.nih.gov:8080/ogsa/services/ogsadai/Duke_caBIODataServiceFactory", is highlighted with a black arrow pointing from the "Services advertised" box to it. To the right of the "caGrid Registry" box is a "DAISGR Output Console" window. It displays XML code representing a TerminationTime SDE. Below the XML, there are sections for "Registered service URLs" containing URLs like "http://156.40.48.168:8080/ogsa/services/ogsadai/GeorgeTown_caBIODataServiceFactory" and "http://cbiogrid101.nci.nih.gov:8080/ogsa/services/ogsadai/Duke_caBIODataServiceFactory". Further down, there are more sections for "Registered service URLs" with URLs such as "http://cbiogrid102.nci.nih.gov:8080/ogsa/services/ogsadai/NCICB_caBIODataServiceFactory" and "http://jforge.net:8080/ogsa/services/ogsadai/Panther1_caBIODataServiceFactory". At the bottom of the interface, a copyright notice reads: "© International Business Machines Corporation, 2002, 2003. © University of Edinburgh, 2002, 2003."
